### Aquatic Vegetation Mapping Report

## Overview

---

The City of Greater Sudbury is home to over 330 freshwater lakes, more than any other municipality in Canada. These lakes provide citizens and tourists with a vast array of recreational opportunities as well as providing a source of clean drinking water to a large portion of the municipality. Over the last few decades our local lakes have come under threat of aquatic invasive species, such as Eurasian Watermilfoil. There are currently 18 lakes within City of Sudbury boundaries that are impacted with the growth of Eurasian Watermilfoil, a fast growing and dense aquatic vegetation species that has many negative effects on aquatic wildlife and recreational activities.

The City's Lake Water Quality Program has been involved in various education and awareness campaigns for aquatic invasive species for several years and continues to expand these efforts to ensure that residents are well-informed on this topic. In 2017, the Lake Water Quality Program revisited the original aquatic vegetation mapping program that was done on multiple lakes in the city in 2014 to enhance our understanding of the spread and impact of Eurasian Watermilfoil on local waterways. A new, more rigorous and robust sampling protocol was developed that results in mapping all aquatic plant species within the affected lakes. The protocol consists of systematic, quantitative and replicable sampling that allows the mapping and tracking of growth or declines of all aquatic plant species within the sampled lakes over time. The results of the sampling in 2017 on St. Charles Lake revealed a total of 18 aquatic plant species within the lake. Eurasian Watermilfoil (*Myriophyllum spicatum*) was the most frequent species recorded followed by the following native species: Muskgrass (*Chara spp.*), Slender Pondweed (*Potamogeton pusillus*) and Northern Watermilfoil (*Myriophyllum sibiricum*). In 2018, Richard Lake was surveyed and 15 species were recorded within the lake. The most frequent species recorded was native Muskgrass (*Chara spp.*) followed by Flat-Stem Pondweed (*Potamogeton zosterifolius*), Eurasian Watermilfoil (*Myriophyllum spicatum*) and Northern Watermilfoil (*Myriophyllum sibiricum*). This report provides details on the aquatic vegetation sampling efforts undertaken on these two lakes.

## Methodology

---

The Lake Water Quality Program has based its aquatic vegetation sampling efforts on the baseline monitoring protocol developed by the Wisconsin Department of Natural Resources (Hauxwell et al, 2010). This protocol employs a point-intercept sampling design that overlays a number of geo-referenced points in a grid pattern over the lake to ensure that year over year results are comparable. The sampling protocol permits the assessment of all aquatic plant species as well as an estimation of species richness, frequency, abundance and maximum depth of colonization within the lake.

### **Aquatic Plant Distribution Maps**

The protocol outlines the basic information needed to create an evenly distributed grid that is overlaid onto the lakes' littoral areas to ensure consistent mapping throughout the water body. The littoral areas of a lake are those where sunlight is able to penetrate down the sediment and, as a result, where the most abundant plant growth is found. The sampling protocol defines the littoral area as occurring in 6 meters of water depth at most.

[Aquatic Vegetation Mapping Report](#)

The sampling grid resolution was calculated from the following factors: 1) the lake's area in hectares, 2) the percentage of the lake's littoral area, and 3) the shoreline development factor or 'SDF'. The SDF is the ratio of the length of the shoreline to the circumference of a circle equal in area to that of the lake; it is not a measure of housing development on a given lake (Mikulyuketal et al, 2010). A higher SDF signals greater complexity of a given shoreline, which allows for increased development of the aquatic plant communities in the littoral area.

Following the protocol, the number of sampling locations on St. Charles Lake and Richard Lake were determined to be 304 points and 260 points, respectively (see Figures 1 and 2). The number of sampling points was then used to create an evenly disturbed grid onto the littoral areas of each lake. Each point is geo-referenced using NAD83 UTM coordinates (see Appendix A – Coordinates).

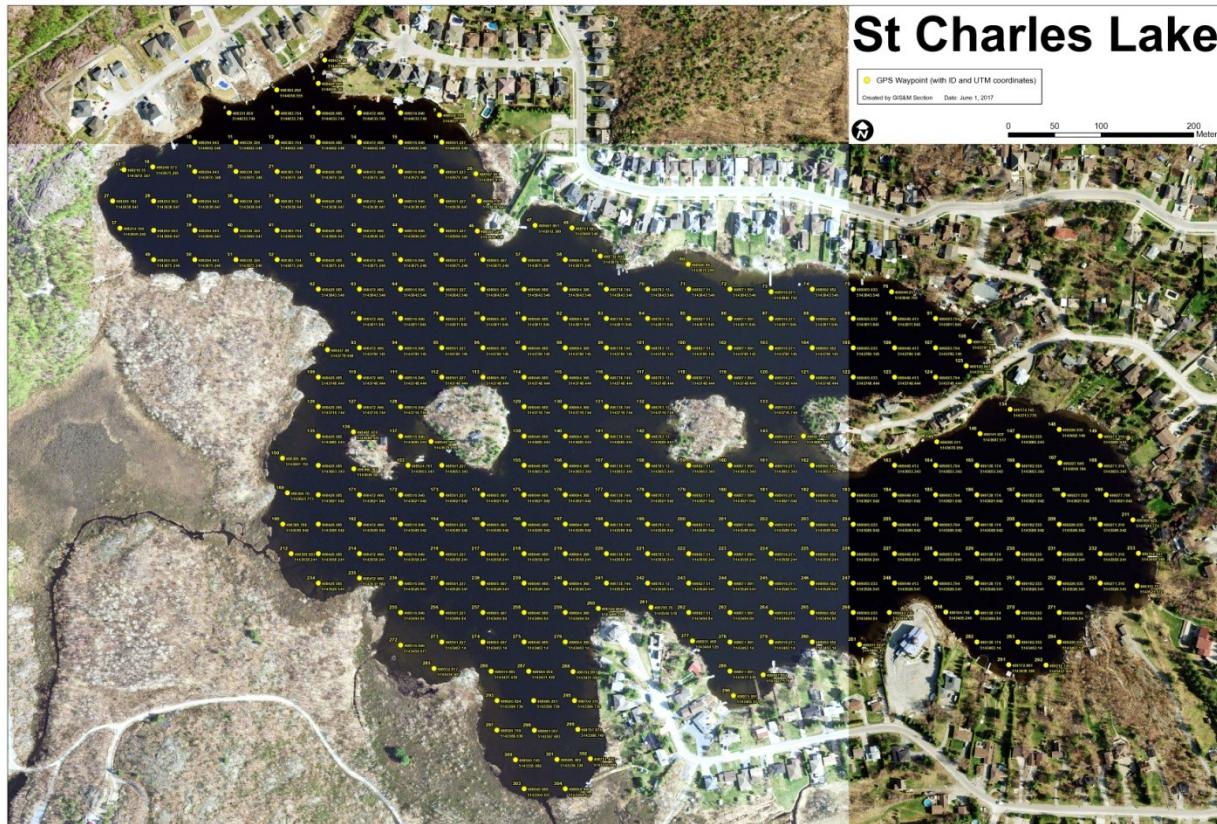

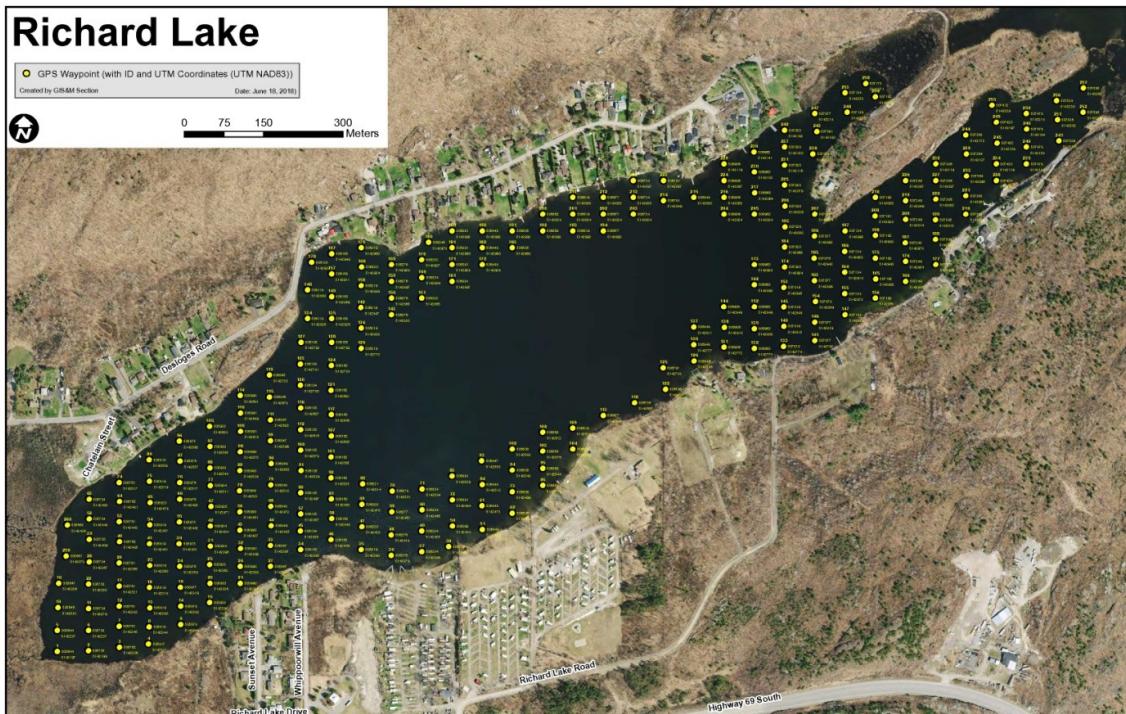

Figure 1. Map of the geo-referenced sampling points for St. Charles Lake.

**Figure 2. Map of the geo-referenced sampling points for Richard Lake. Following the protocol, areas greater than 6m in depth are not sampled.**

### Field Survey Techniques & Equipment

Field surveys for the aquatic vegetation mapping require relatively little equipment. Foremost is the rake sampler, which comes in many forms. The City uses the same rake sampler for each lake to ensure consistency. The rake sampler used is a 19-tine thatching rake with the head removed and secured to a 50' section of rope, see Figure 3. The thatching rake was selected for its double sided design, low cost and its ability to effectively remove and hold aquatic vegetation while sampling. A Garmin GPSMAP 64S handheld global positioning system, GPS, was used to navigate to each sampling location. The location reported by the GPS is accurate to within 15 meters and will generally have accuracy within 5 to 10 meters under normal conditions (Garmin Ltd. 2019).

Aquatic vegetation sampling on St. Charles Lake took place between July 31, 2017 and August 8, 2017 and Richard Lake sampling took place between August 1, 2018 and August 20, 2018. The sampling period ensured that the aquatic vegetation within the lake was near peak growth. At each sampling point, the rake was tossed into the water within 1-3 meters of the watercraft and dragged across the substrate before being pulled into the watercraft. Rake fullness was recorded starting in 2018 on Richard Lake to help determine density of plant growth at each site with species being recorded and identified. After each rake toss the watercraft was relocated to

**Figure 3. City of Greater Sudbury modified thatching rake used for aquatic vegetation sampling.**

compensate for any movement that may have occurred. A total of three (3) rake tosses were completed at each sampling point to ensure an accurate representation of plant species at each site.

The results from each lake were inputted into GIS software and overlaid on satellite imagery to create a visualization of the extent of each species within the water body. Maps of the aquatic plant species found in St. Charles Lake and Richard Lake can be found in Appendix B and C respectively.

## Results

---

### **St. Charles Lake**

A total of 304 points were sampled on St. Charles Lake from which a total of 18 aquatic plant species were recorded. The four most frequent species recorded were Eurasian Watermilfoil (*Myriophyllum spicatum*), and the following native species: Muskgrass (*Chara* spp.), Slender Pondweed (*Potamogeton pusillus*) and Northern Watermilfoil (*Myriophyllum sibiricum*). Table 1 lists the aquatic plant species recorded and their frequency of occurrence.

**Table 1. Aquatic plant species recorded in St. Charles Lake in 2017.**

| Common Name           | Scientific Name                 | # of sampling points where present | % of sampling points |
|-----------------------|---------------------------------|------------------------------------|----------------------|
| Eurasian Watermilfoil | <i>Myriophyllum spicatum</i>    | 197                                | 64.8%                |
| Muskgrass             | <i>Chara</i> spp.               | 161                                | 53.0%                |
| Slender Pondweed      | <i>Potamogeton pusillus</i>     | 154                                | 50.7%                |
| Northern Watermilfoil | <i>Myriophyllum sibiricum</i>   | 103                                | 33.9%                |
| Largeleaf Pondweed    | <i>Potamogeton amplifolius</i>  | 24                                 | 7.9%                 |
| Slender Watermilfoil  | <i>Myriophyllum tenellum</i>    | 23                                 | 7.6%                 |
| Common Pipewort       | <i>Eriocaulon aquaticum</i>     | 20                                 | 6.6%                 |
| Spiny-spore Quillwort | <i>Isoetes echinospora</i>      | 10                                 | 3.3%                 |
| Yellow Waterlily      | <i>Nuphar lutea</i>             | 8                                  | 2.6%                 |
| White Waterlily       | <i>Nymphaea odorata</i>         | 7                                  | 2.3%                 |
| Richardsons Pondweed  | <i>Potamogeton richardsonii</i> | 6                                  | 2.0%                 |
| Nodding Waternymph    | <i>Najas flexilis</i>           | 3                                  | 1.0%                 |
| Canadian Waterweed    | <i>Elodea canadensis</i>        | 2                                  | 0.7%                 |
| Wild Celery           | <i>Vallisneria americana</i>    | 2                                  | 0.7%                 |
| Watershield           | <i>Brasenia schreberi</i>       | 1                                  | 0.3%                 |
| Water Smartweed       | <i>Persicaria amphibia</i>      | 1                                  | 0.3%                 |
| Sweet Gale            | <i>Myrica gale</i>              | 1                                  | 0.3%                 |
| Leafy Pondweed        | <i>Potamogeton foliosus</i>     | 1                                  | 0.3%                 |

The presence/absence for each species on St. Charles Lake was compiled and overlaid onto geo-referenced satellite imagery. These data were then projected onto a map to show the total extent of each aquatic species throughout the lake. These maps can be found in Appendix B – St. Charles Lake Vegetation Mapping Results.

The species information collected on St. Charles Lake helps sheds light on the extent of the growth of Eurasian Watermilfoil in the lake and whether this invasive aquatic plant is having a negative impact on the native aquatic plants within the lake. The results indicate that at 57% of the sampling points there was a mixture of Eurasian Watermilfoil and native species growing together, at 8% of the sampling points Eurasian Watermilfoil was recorded exclusively, at 8% of sampling points no aquatic plants were recorded and at 27% of sampling points only native aquatic species were recorded. See Table 2 for full details below.

**Table 2. Composition of native and invasive aquatic vegetation throughout St. Charles Lake.**

|                      | Eurasian Watermilfoil Only | Native Species Only | Mixture of Eurasian Watermilfoil & Native Species | No Vegetation Present |
|----------------------|----------------------------|---------------------|---|-----------------------|
| # of sampling points | 24                         | 81                  | 173   | 26                    |
| % of Lake            | 7.9%                       | 26.6%               | 56.9%   | 8.6%                  |

### *Richard Lake*

A total of 260 points were sampled in Richard Lake in 2018. At each sampling point, the ‘rake fullness’ was estimated and the dominant species was noted, as long as dominance was clearly observable. A total of 14 aquatic plant species were recorded of which the following four species were most common: Muskgrass (*Chara* spp.), Flat-stem Pondweed (*Potamogeton zosterifolius*), Eurasian Watermilfoil (*Myriophyllum spicatum*) and Northern Watermilfoil (*Myriophyllum sibiricum*) respectively. A list of the aquatic species recorded along with the total number of sampling points at which each was found is presented on Table 3.

Maps of the presence/absence for each species on Richard Lake can be found in Appendix C – Richard Lake Vegetation Mapping Results. Additionally, maps were created to show the dominant species at each sampling point (Figure 4), along with the density of the plant growth at each point (Figure 5), and a map detailing the sampling points where invasive Eurasian Watermilfoil and native Northern Watermilfoil are growing together or separately (Figure 6).

The species information collected on Richard Lake will serve as a baseline for comparisons with future aquatic plant surveys in the lake and will assist in determining if Eurasian Water-milfoil is having a negative impact on the native aquatic species within the lake. Data collected in 2018 show that at 22% of the sampling points there was a mixture of both native aquatic species and the invasive Eurasian Watermilfoil, at 44% of sampling points no aquatic plant growth was recorded, at 32% of the sampling points only native species occurred and at only 2% of the sampling points Eurasian Watermilfoil grew exclusively (Table 4).

**Table 3. Frequency of aquatic plant species recorded in Richard Lake in 2018.**

| Common Name            | Scientific Name                  | # of sampling points where present | % of sampling points |
|------------------------|----------------------------------|------------------------------------|----------------------|
| Muskgrass/Stonewort    | <i>Chara</i> spp.                | 77                                 | 29.6%                |
| Flat-Stem Pondweed     | <i>Potamogeton zosterifolius</i> | 73                                 | 28.1%                |
| Eurasian watermilfoil  | <i>Myriophyllum spicatum</i>     | 64                                 | 24.6%                |
| Northern watermilfoil  | <i>Myriophyllum sibiricum</i>    | 56                                 | 21.5%                |
| Richardson's pondweed  | <i>Potamogeton richardsonii</i>  | 39                                 | 15.0%                |
| Nitella spp            | <i>Nitella</i> spp.              | 19                                 | 7.3%                 |
| Largeleaf pondweed     | <i>Potamogeton amplifolius</i>   | 18                                 | 6.9%                 |
| Spiny-spored quillwort | <i>Isoetes echinospora</i>       | 16                                 | 6.2%                 |
| Slender Naiad          | <i>Najas flexilis</i>            | 12                                 | 4.6%                 |
| White water-lily       | <i>Nymphaea odorata</i>          | 7                                  | 2.7%                 |
| Slender pondweed       | <i>Potamogeton pusillus</i>      | 5                                  | 1.9%                 |
| Canada Waterweed       | <i>Elodea canadensis</i>         | 3                                  | 1.2%                 |
| Tapegrass              | <i>Vallisneria americana</i>     | 3                                  | 1.2%                 |
| Illinois pondweed      | <i>Potamogeton illinoensis</i>   | 1                                  | 0.4%                 |

**Table 4. Composition of native and invasive aquatic vegetation in Richard Lake in 2018.**

|                      | Eurasian Watermilfoil Only | Native Species Only | Mixture of Eurasian Watermilfoil & Native Species | No Vegetation Present |
|----------------------|----------------------------|---------------------|---|-----------------------|
| # of sampling points | 6                          | 83                  | 58  | 113                   |
| % of Sites on Lake   | 2.3%                       | 31.9%               | 22.3%   | 43.5%                 |

## Conclusion

The 2017 and 2018 aquatic vegetation mapping project on St. Charles Lake and Richard Lake has created a robust baseline for aquatic vegetation populations within these two area lakes. The data collected through this mapping project have helped in understanding the current extent of Eurasian Watermilfoil in St. Charles and Richard Lake and have provided information regarding species richness within these water bodies.

Most revealing to date is the relatively high number of sampling points where only native species were recorded. On both lakes this number is above 25% while the areas with monoculture stands of exclusively Eurasian Watermilfoil is below 8% on St. Charles Lake and just above 2% on Richard Lake. These results show that, although the Eurasian Watermilfoil is persistent within these water bodies, this invasive species does not appear to have established in large, widespread monospecific stands. The data also indicate that there are many sites that contain both Eurasian Watermilfoil and the native Northern Watermilfoil along with other native species.

These initial aquatic vegetation mapping surveys will serve as a baseline for future mapping efforts to reveal the dynamics of growth or decline of both Eurasian Watermilfoil and native aquatic plants in these lakes. Aquatic vegetation mapping will continue on other lakes that are affected by Eurasian Watermilfoil to serve as baselines for monitoring aquatic plant species within City lakes.

## Appendix C

---

### *Richard Lake Vegetation Mapping Results*

# Richard Lake

## Canada Waterweed (*Elodea canadensis*)

 Canada Waterweed Present

0 50 100 200 Meters

Data Collected: August 1 to 20, 2019  
Map Created: January 15, 2019  
Created by GIS&M Section

# Richard Lake

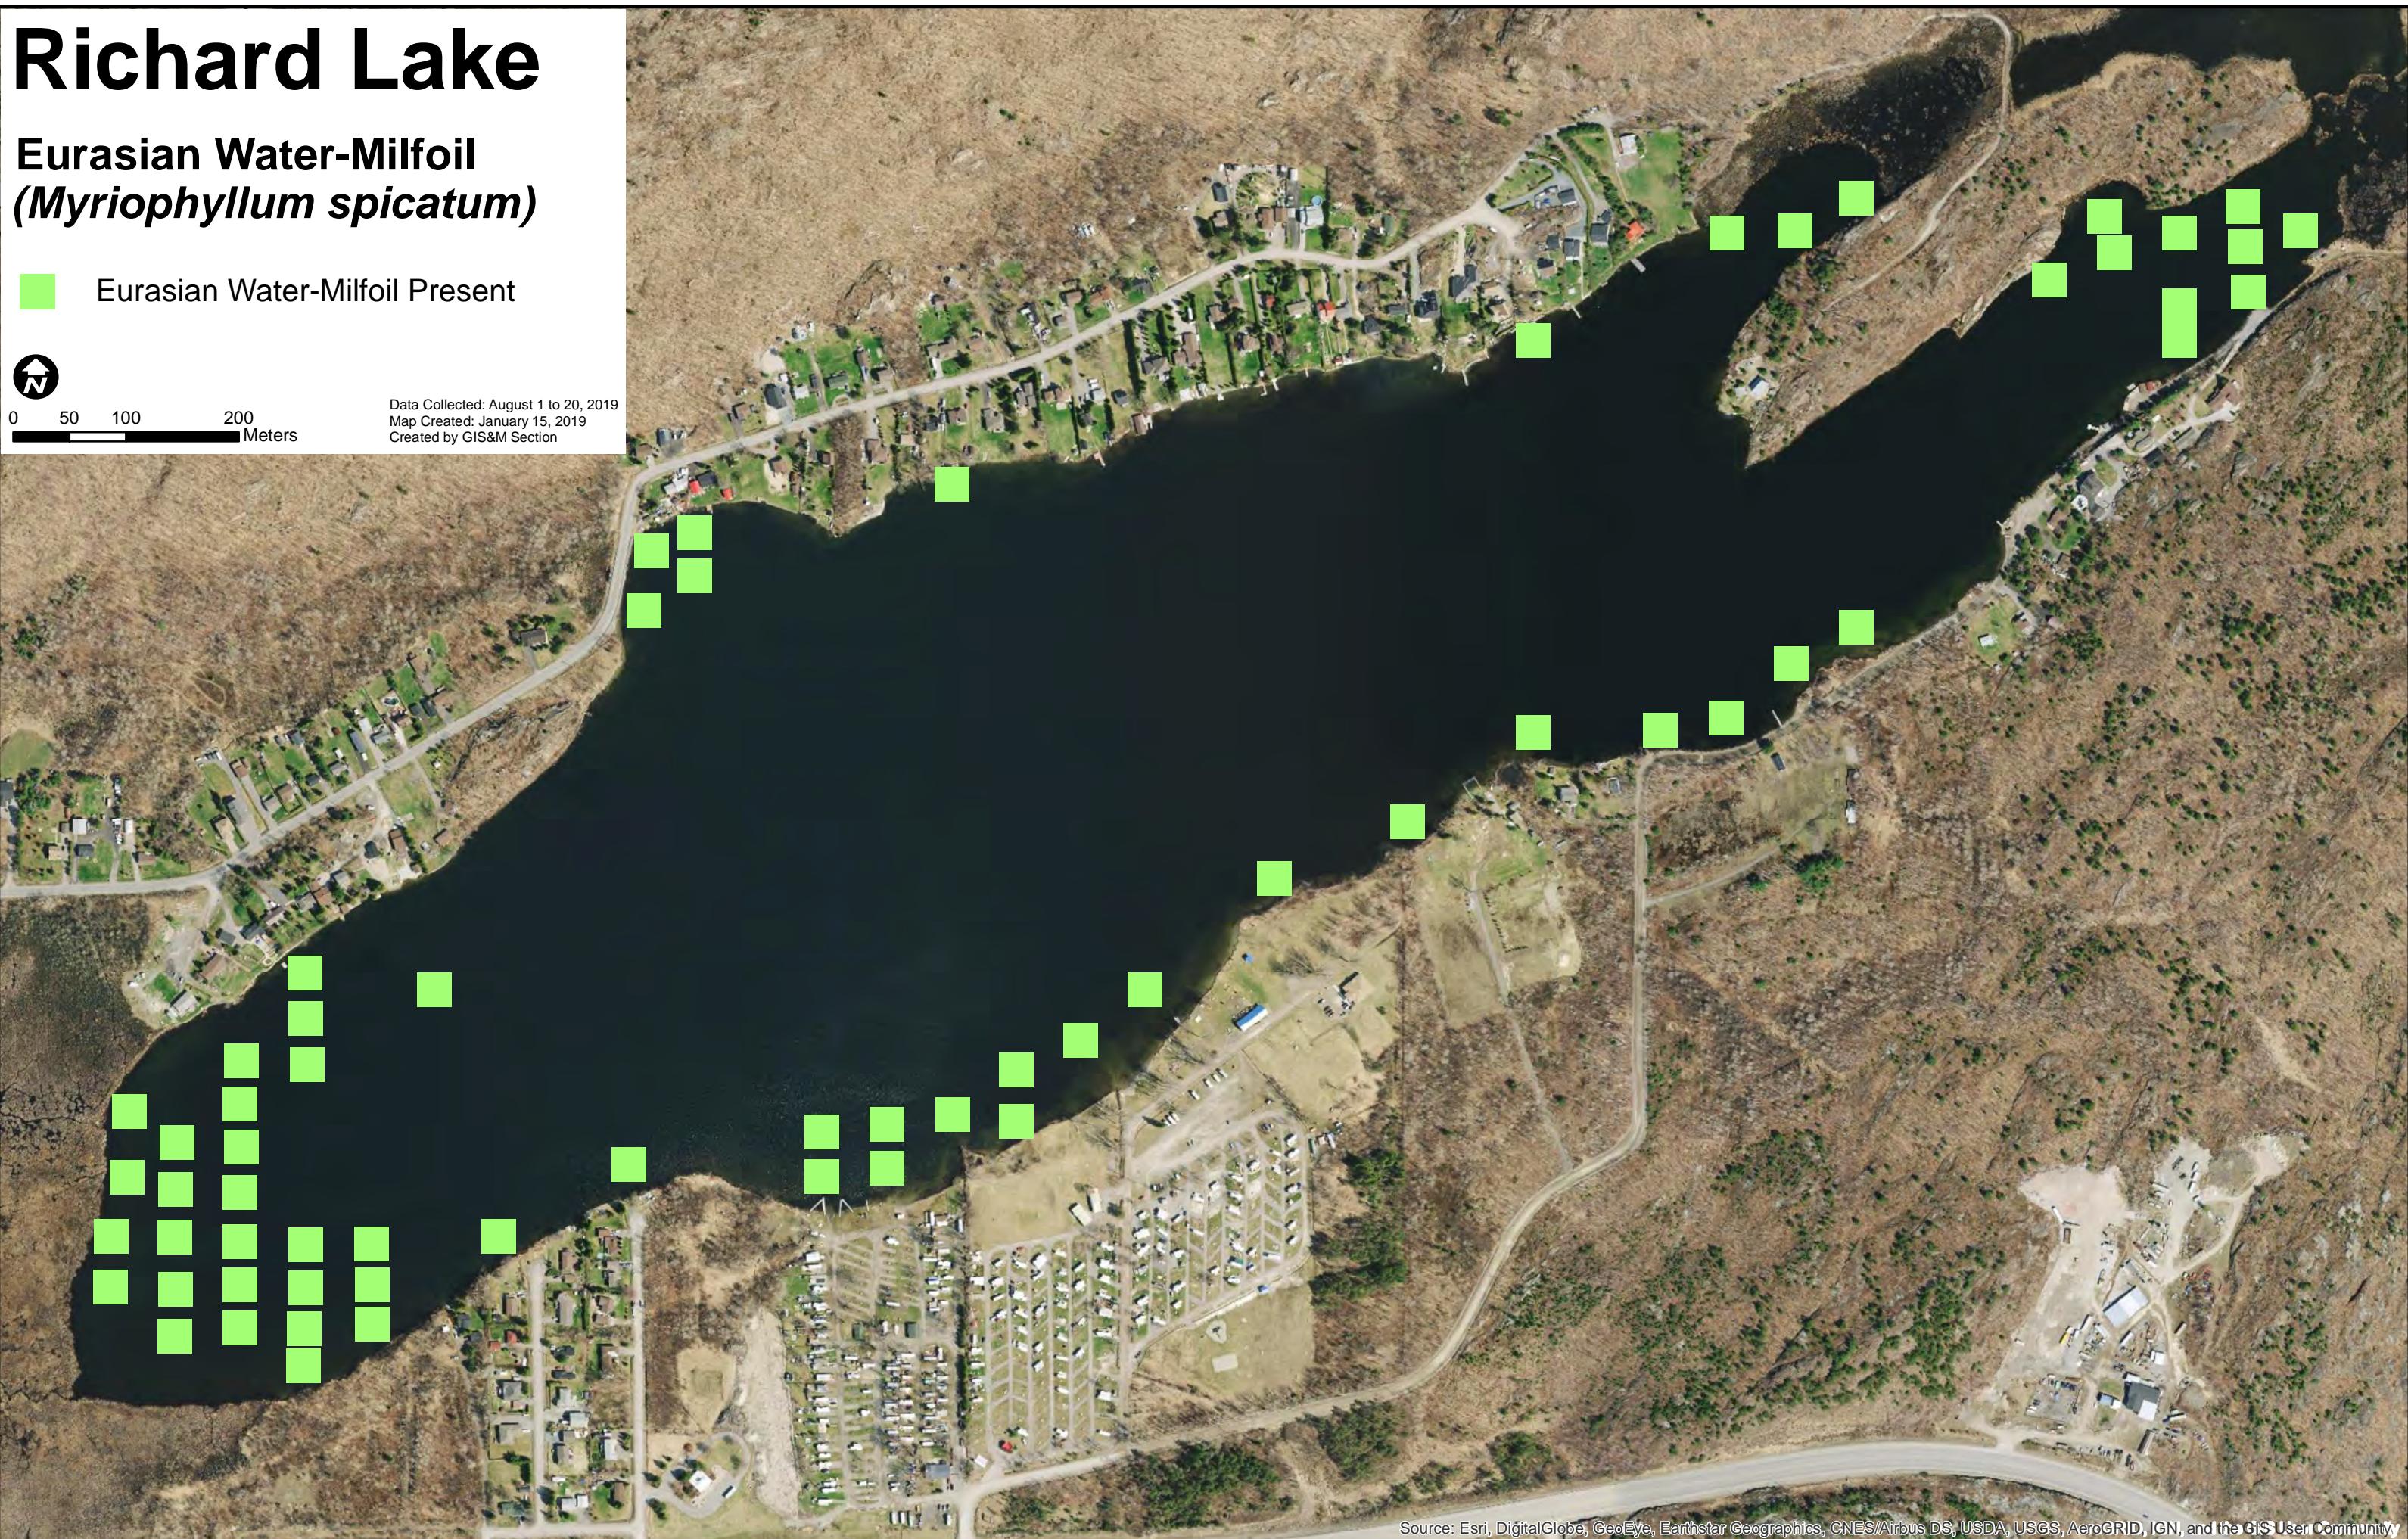

## Eurasian Water-Milfoil (*Myriophyllum spicatum*)

 Eurasian Water-Milfoil Present

0 50 100 200 Meters

Data Collected: August 1 to 20, 2019  
Map Created: January 15, 2019  
Created by GIS&M Section

# Richard Lake

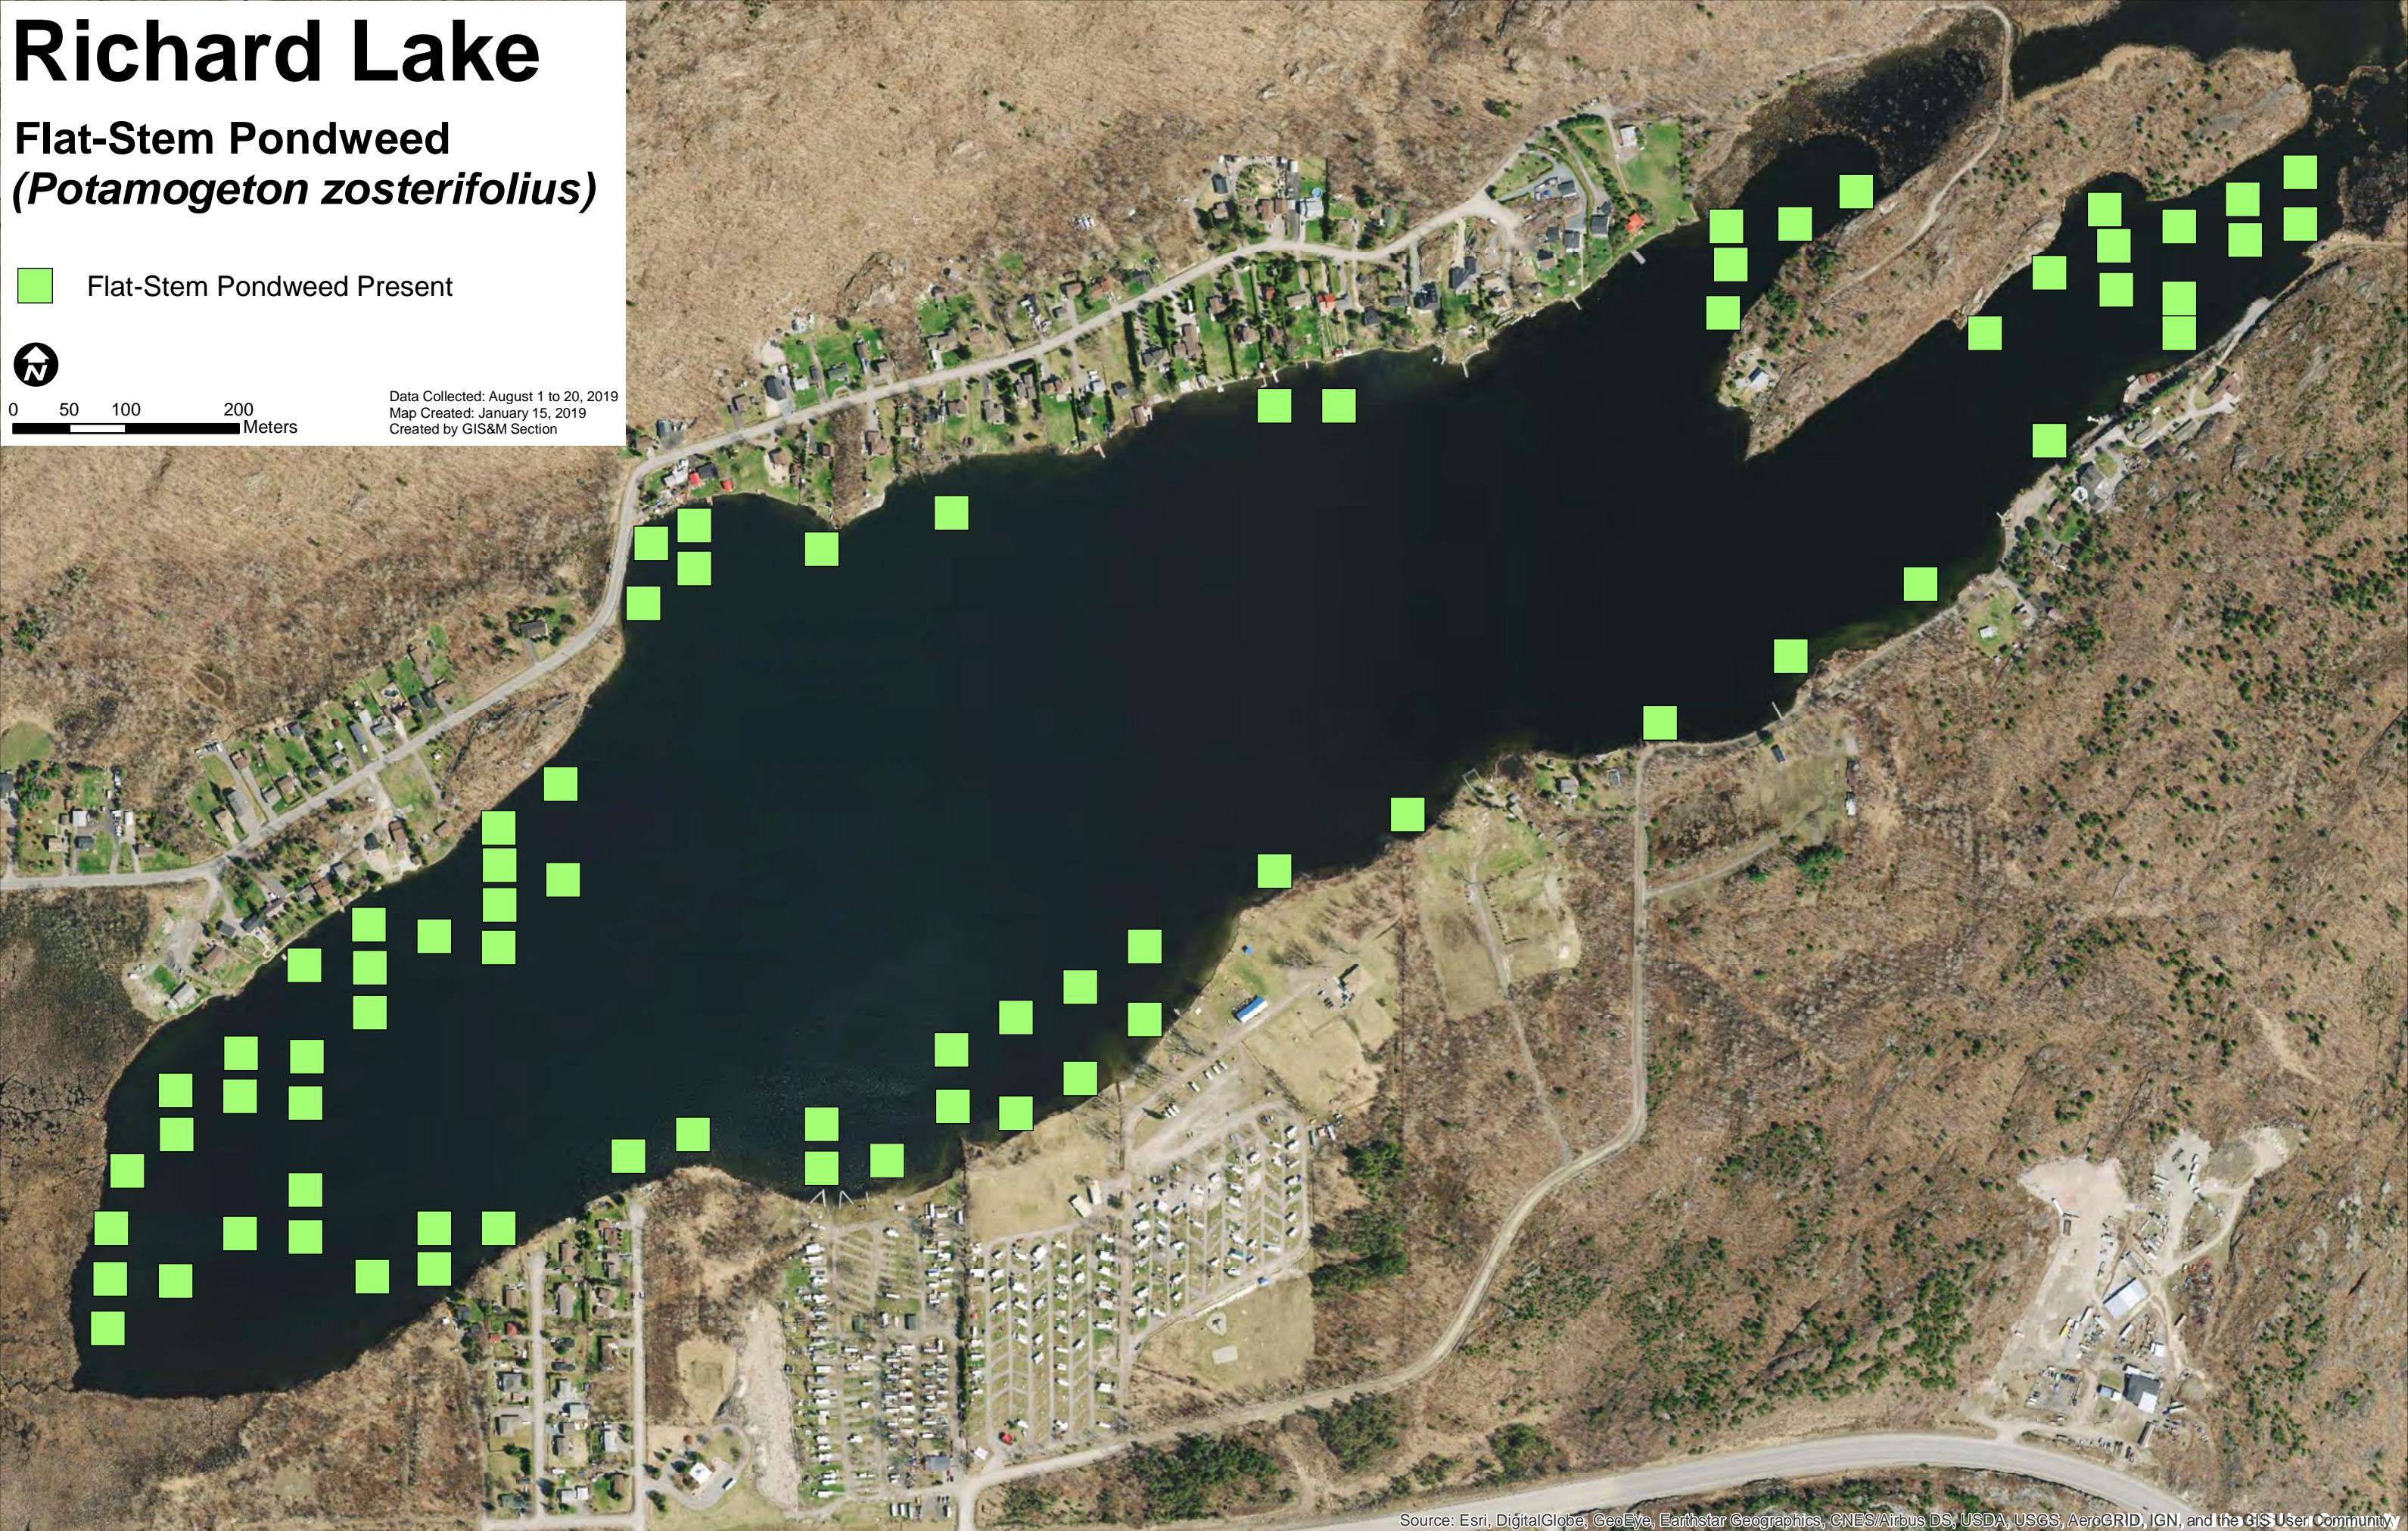

## Flat-Stem Pondweed (*Potamogeton zosterifolius*)

 Flat-Stem Pondweed Present

0 50 100 200 Meters

Data Collected: August 1 to 20, 2019  
Map Created: January 15, 2019  
Created by GIS&M Section

# Richard Lake

## Illinois Pondweed (*Potamogeton illinoensis*)

 Illinois Pondweed Present

0 50 100 200 Meters

Data Collected: August 1 to 20, 2019  
Map Created: January 15, 2019  
Created by GIS&M Section

# Richard Lake

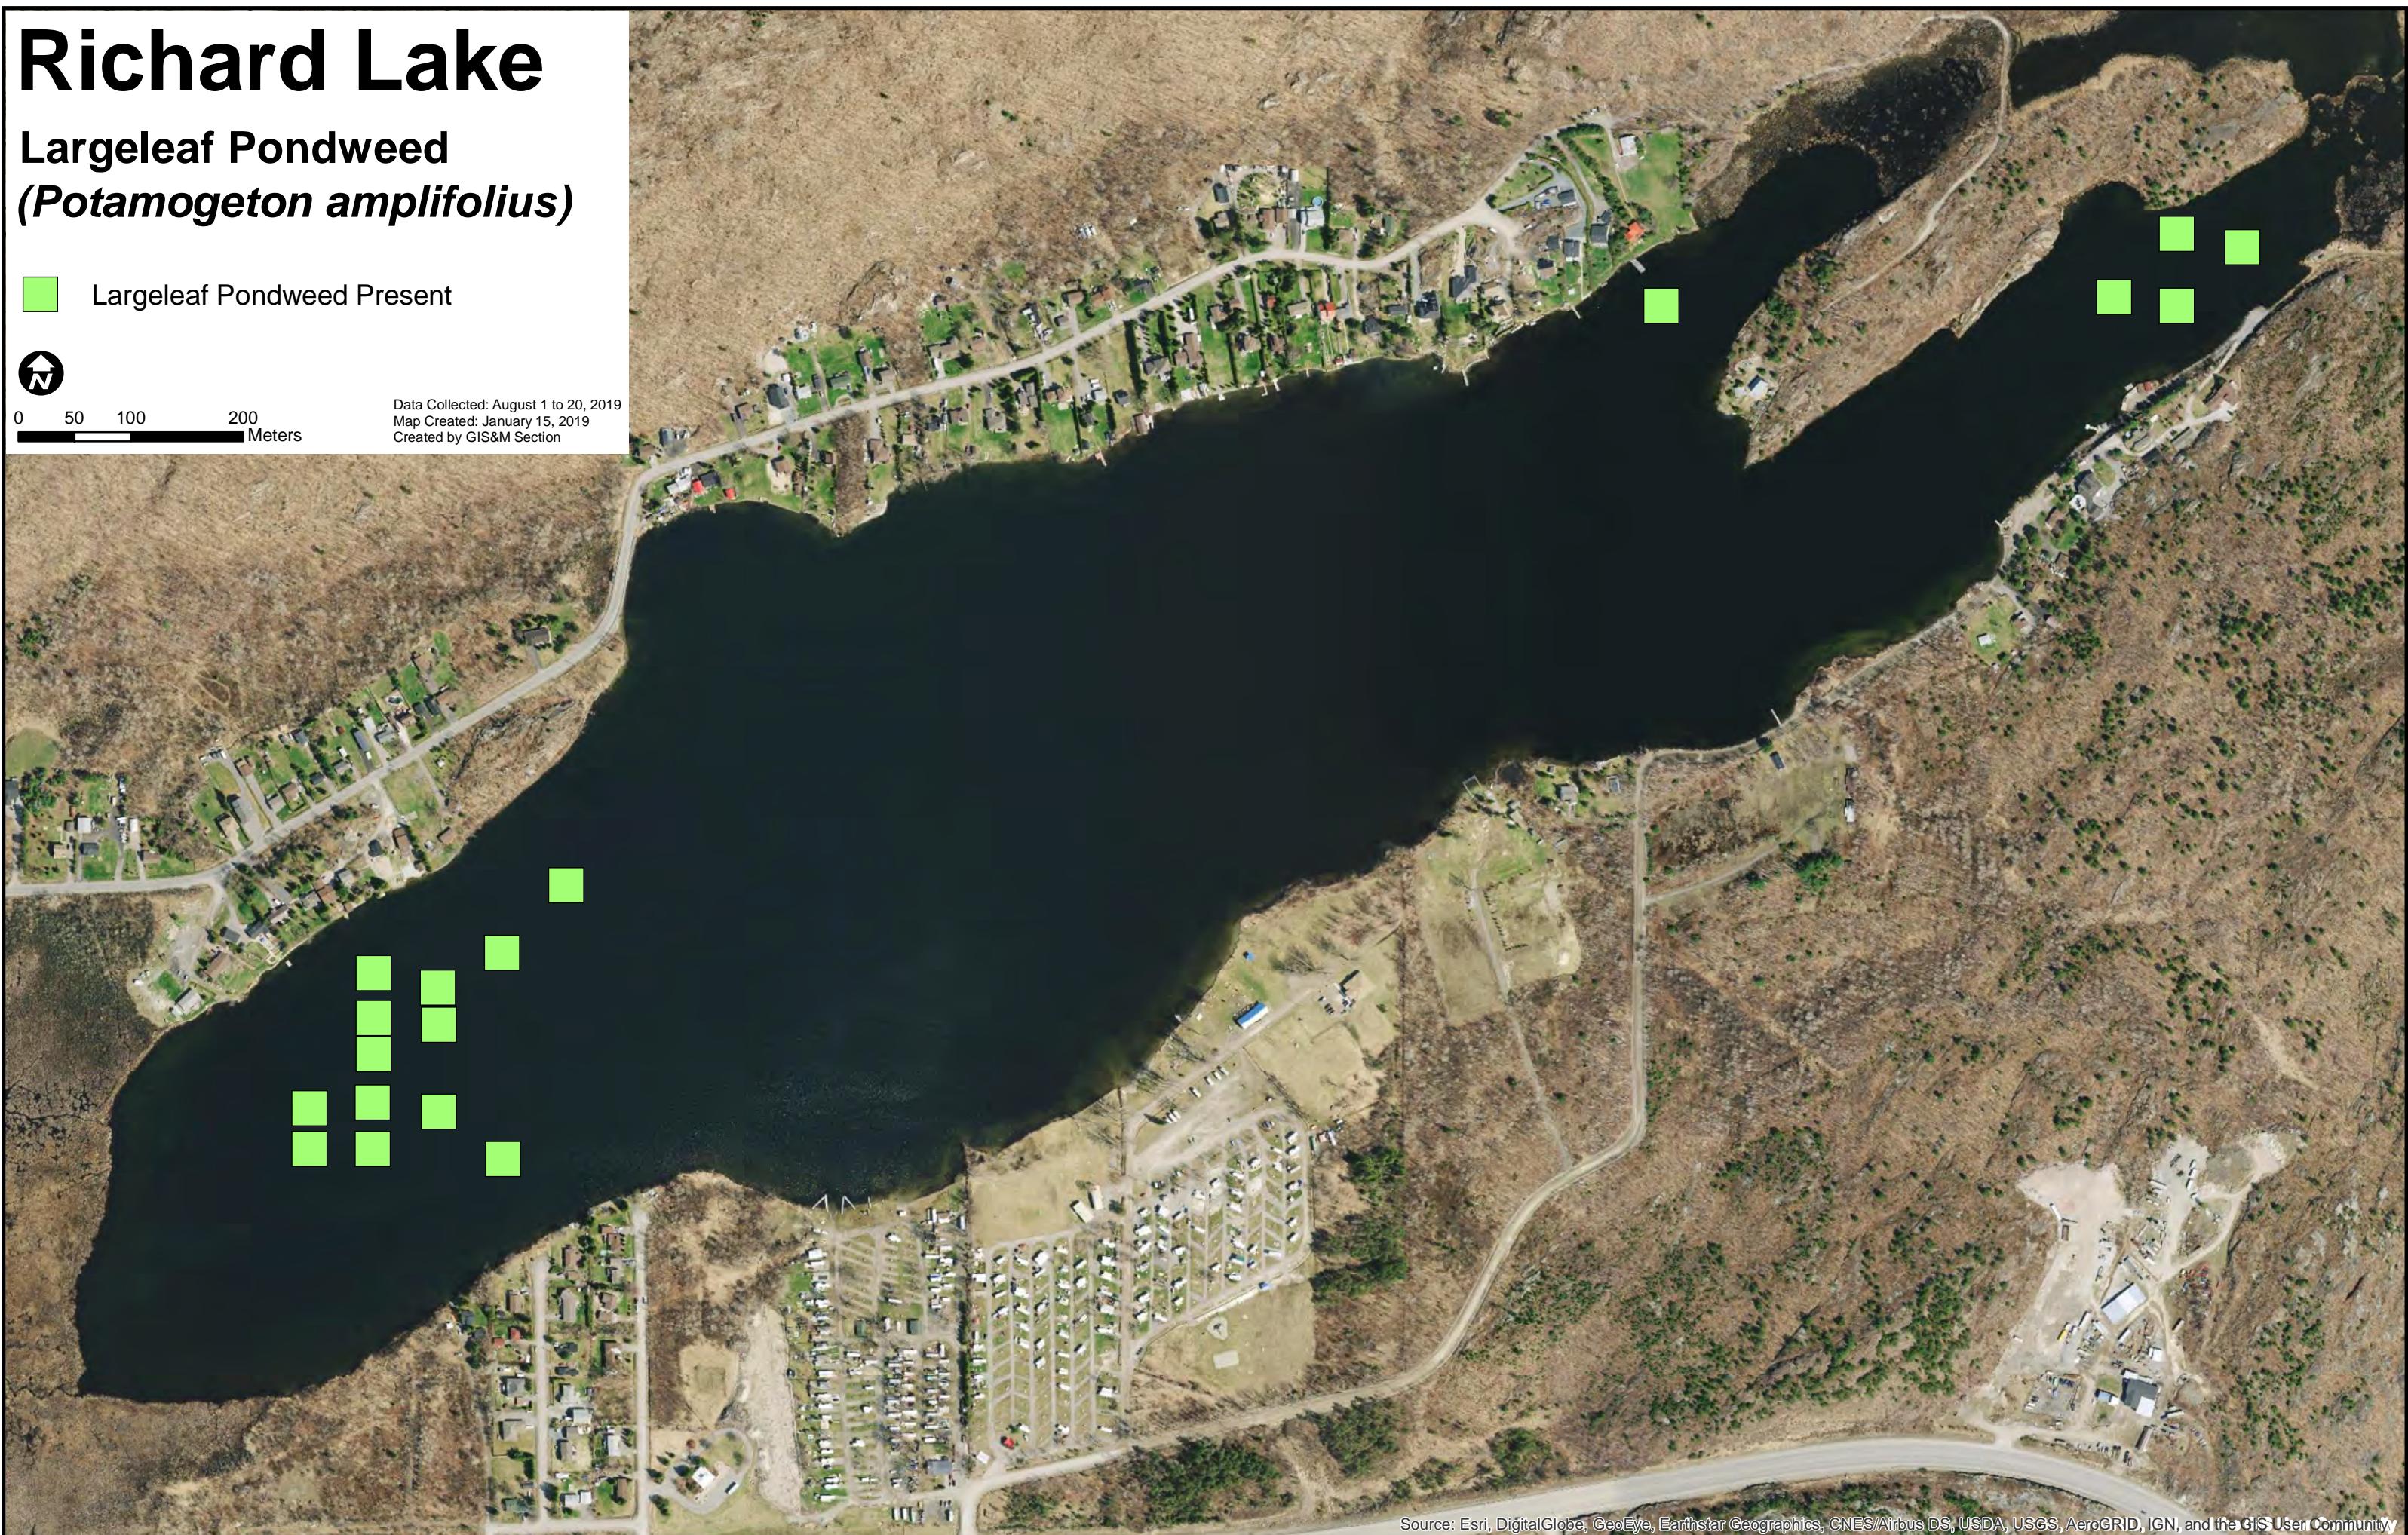

## Largeleaf Pondweed (*Potamogeton amplifolius*)

 Largeleaf Pondweed Present

0 50 100 200 Meters

Data Collected: August 1 to 20, 2019  
Map Created: January 15, 2019  
Created by GIS&M Section

# Richard Lake

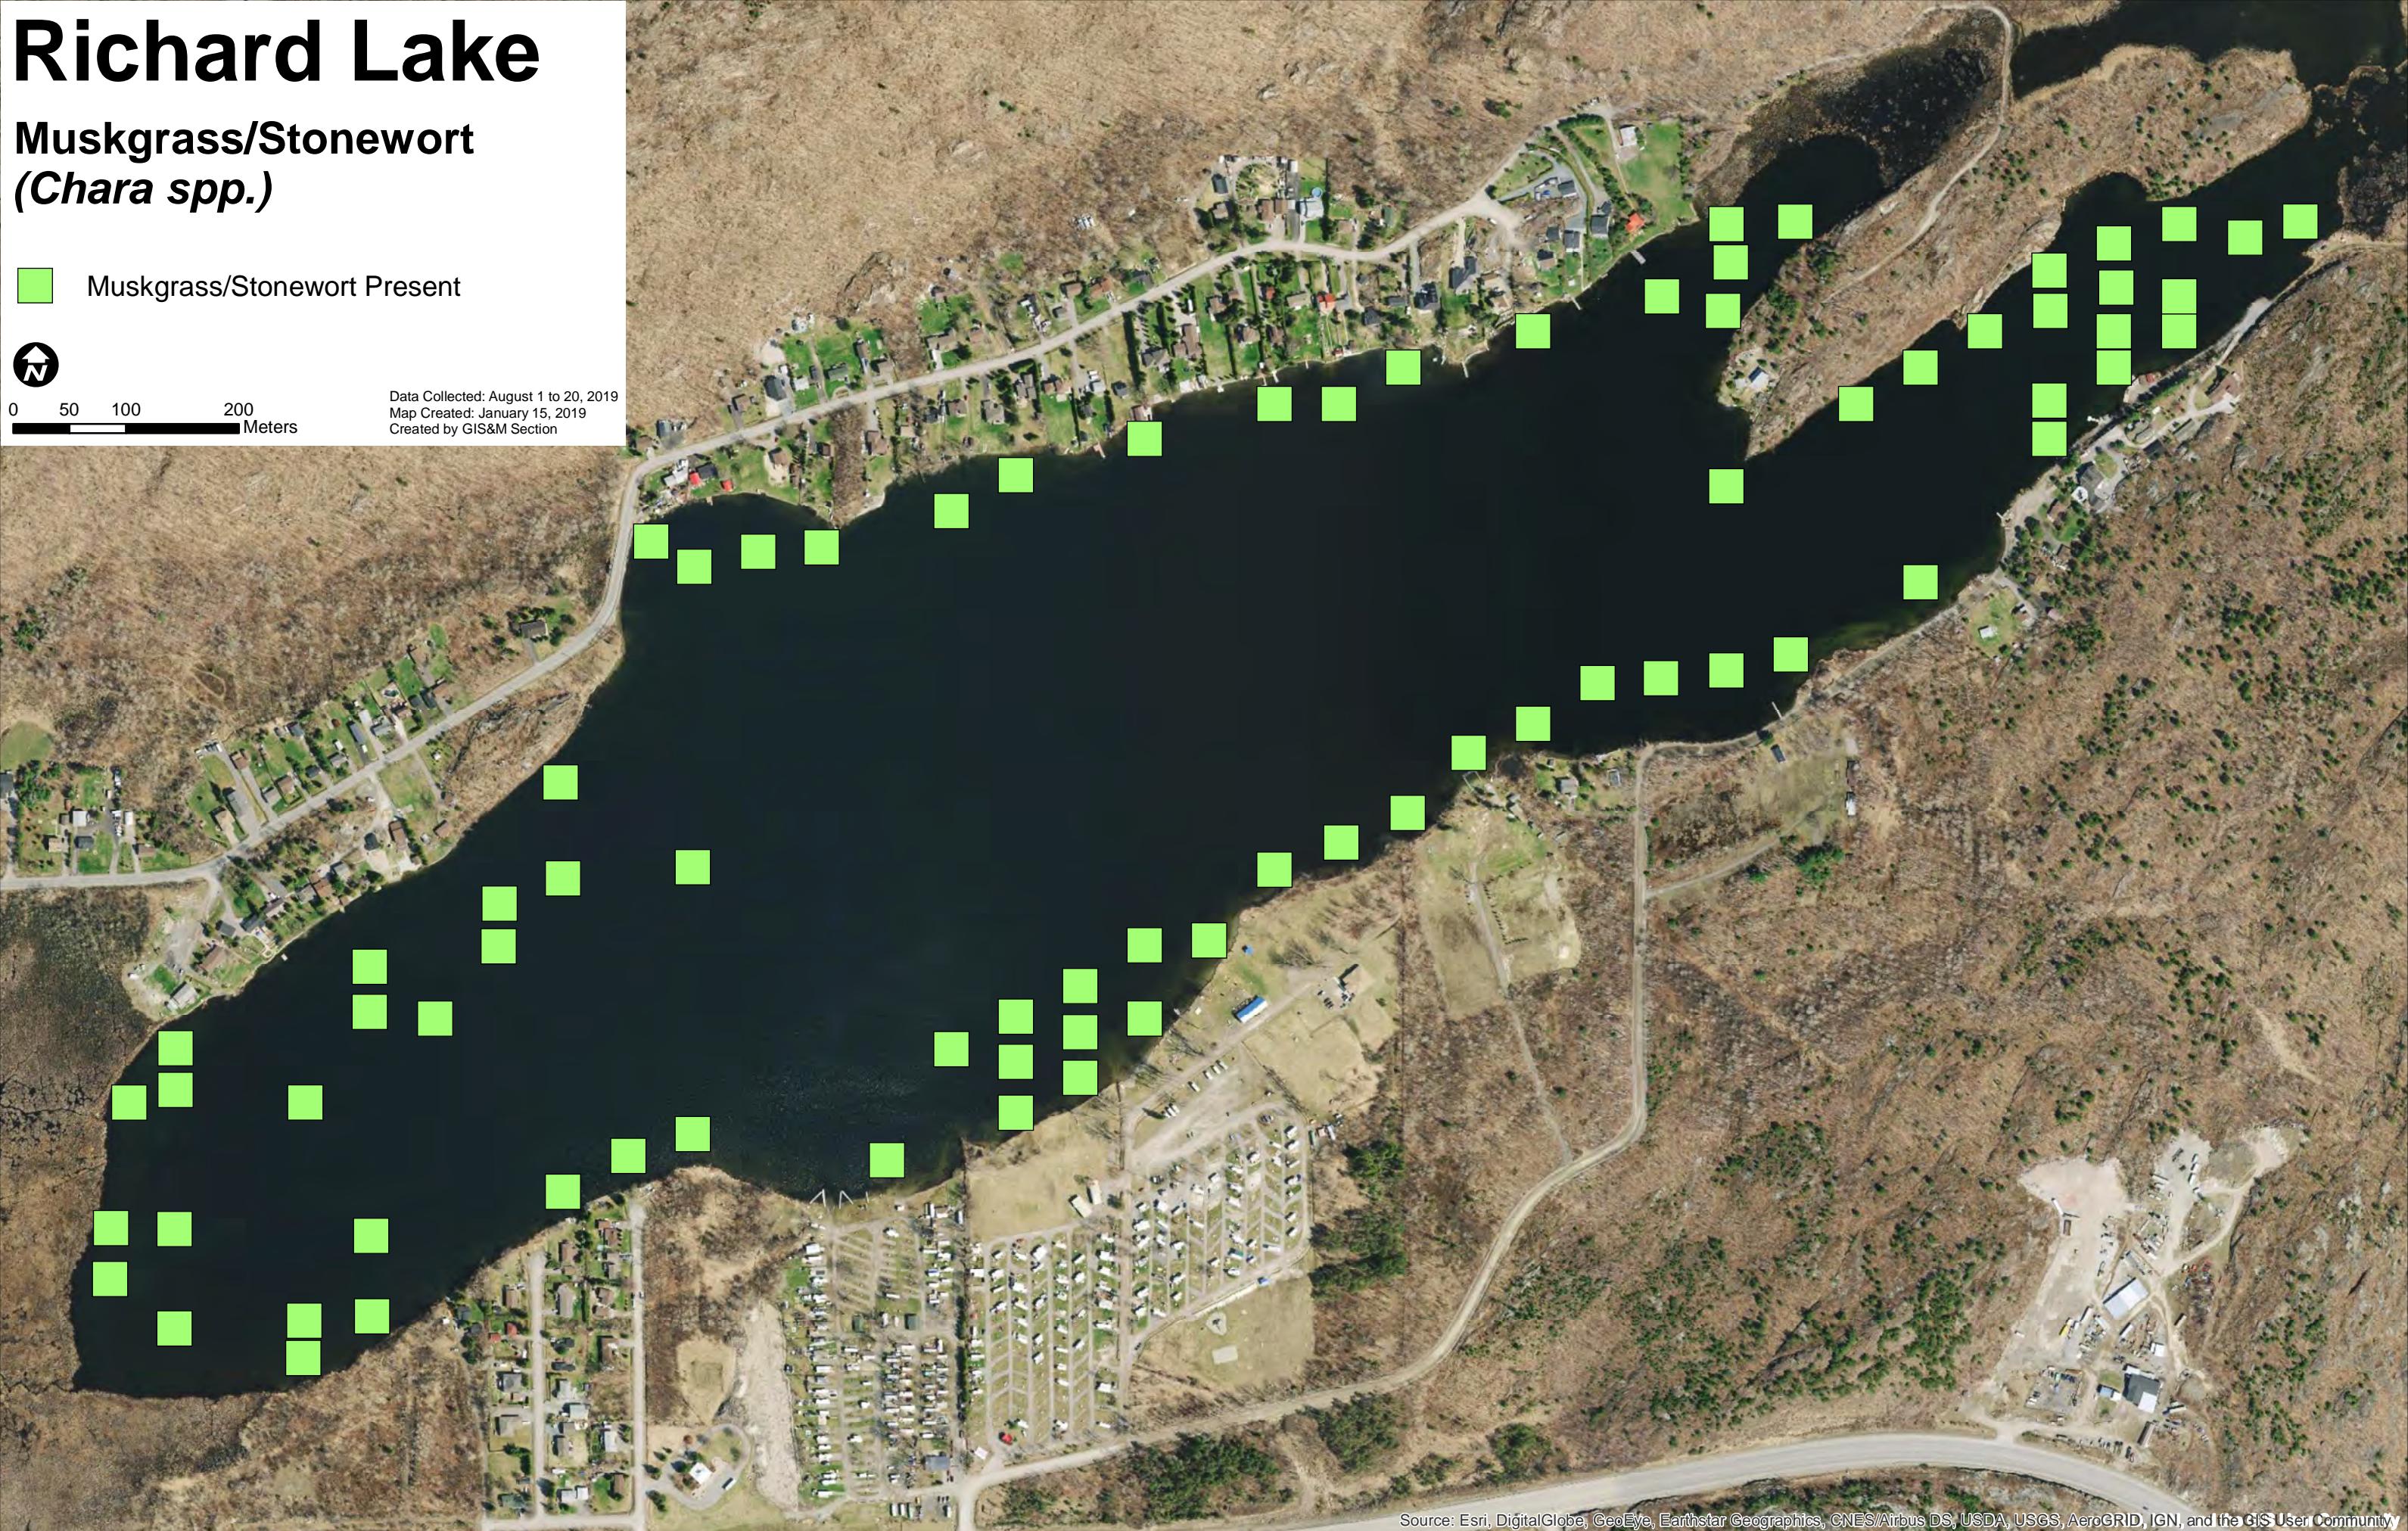

## Muskgrass/Stonewort (*Chara spp.*)

 Muskgrass/Stonewort Present

0 50 100 200 Meters

Data Collected: August 1 to 20, 2019  
Map Created: January 15, 2019  
Created by GIS&M Section

# Richard Lake

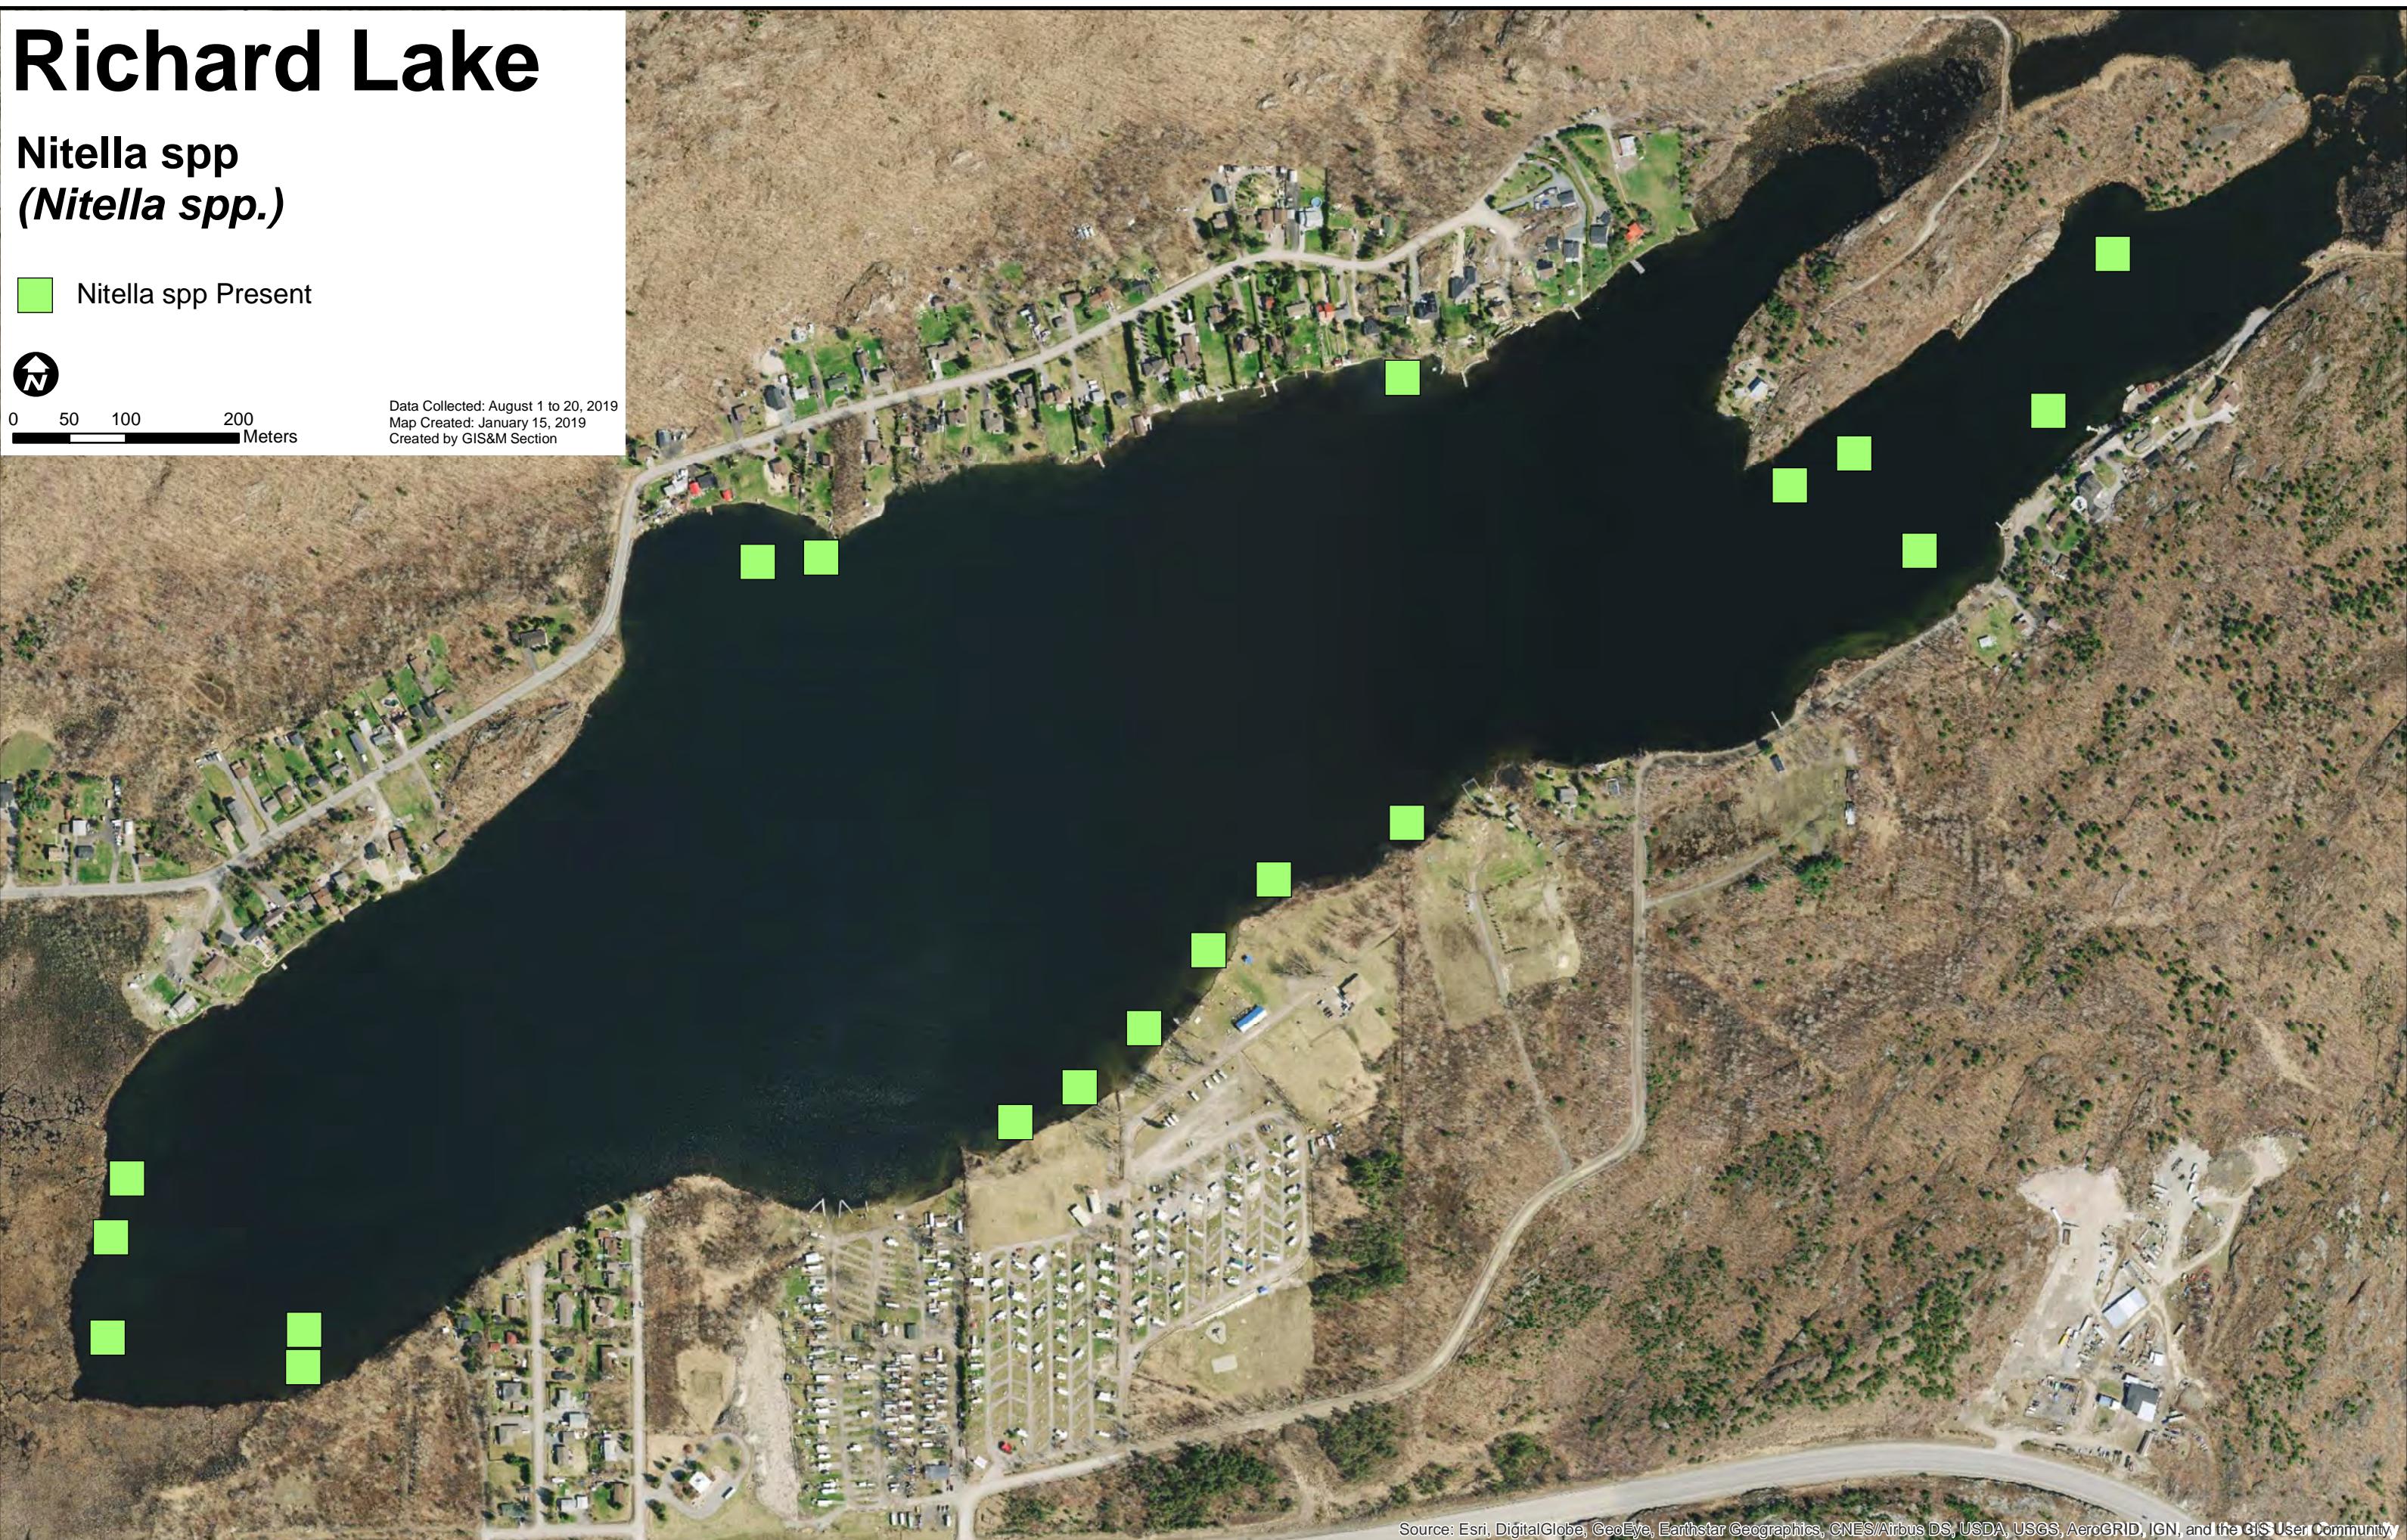

Nitella spp  
(*Nitella spp.*)

 Nitella spp Present

0 50 100 200 Meters

Data Collected: August 1 to 20, 2019  
Map Created: January 15, 2019  
Created by GIS&M Section

# Richard Lake

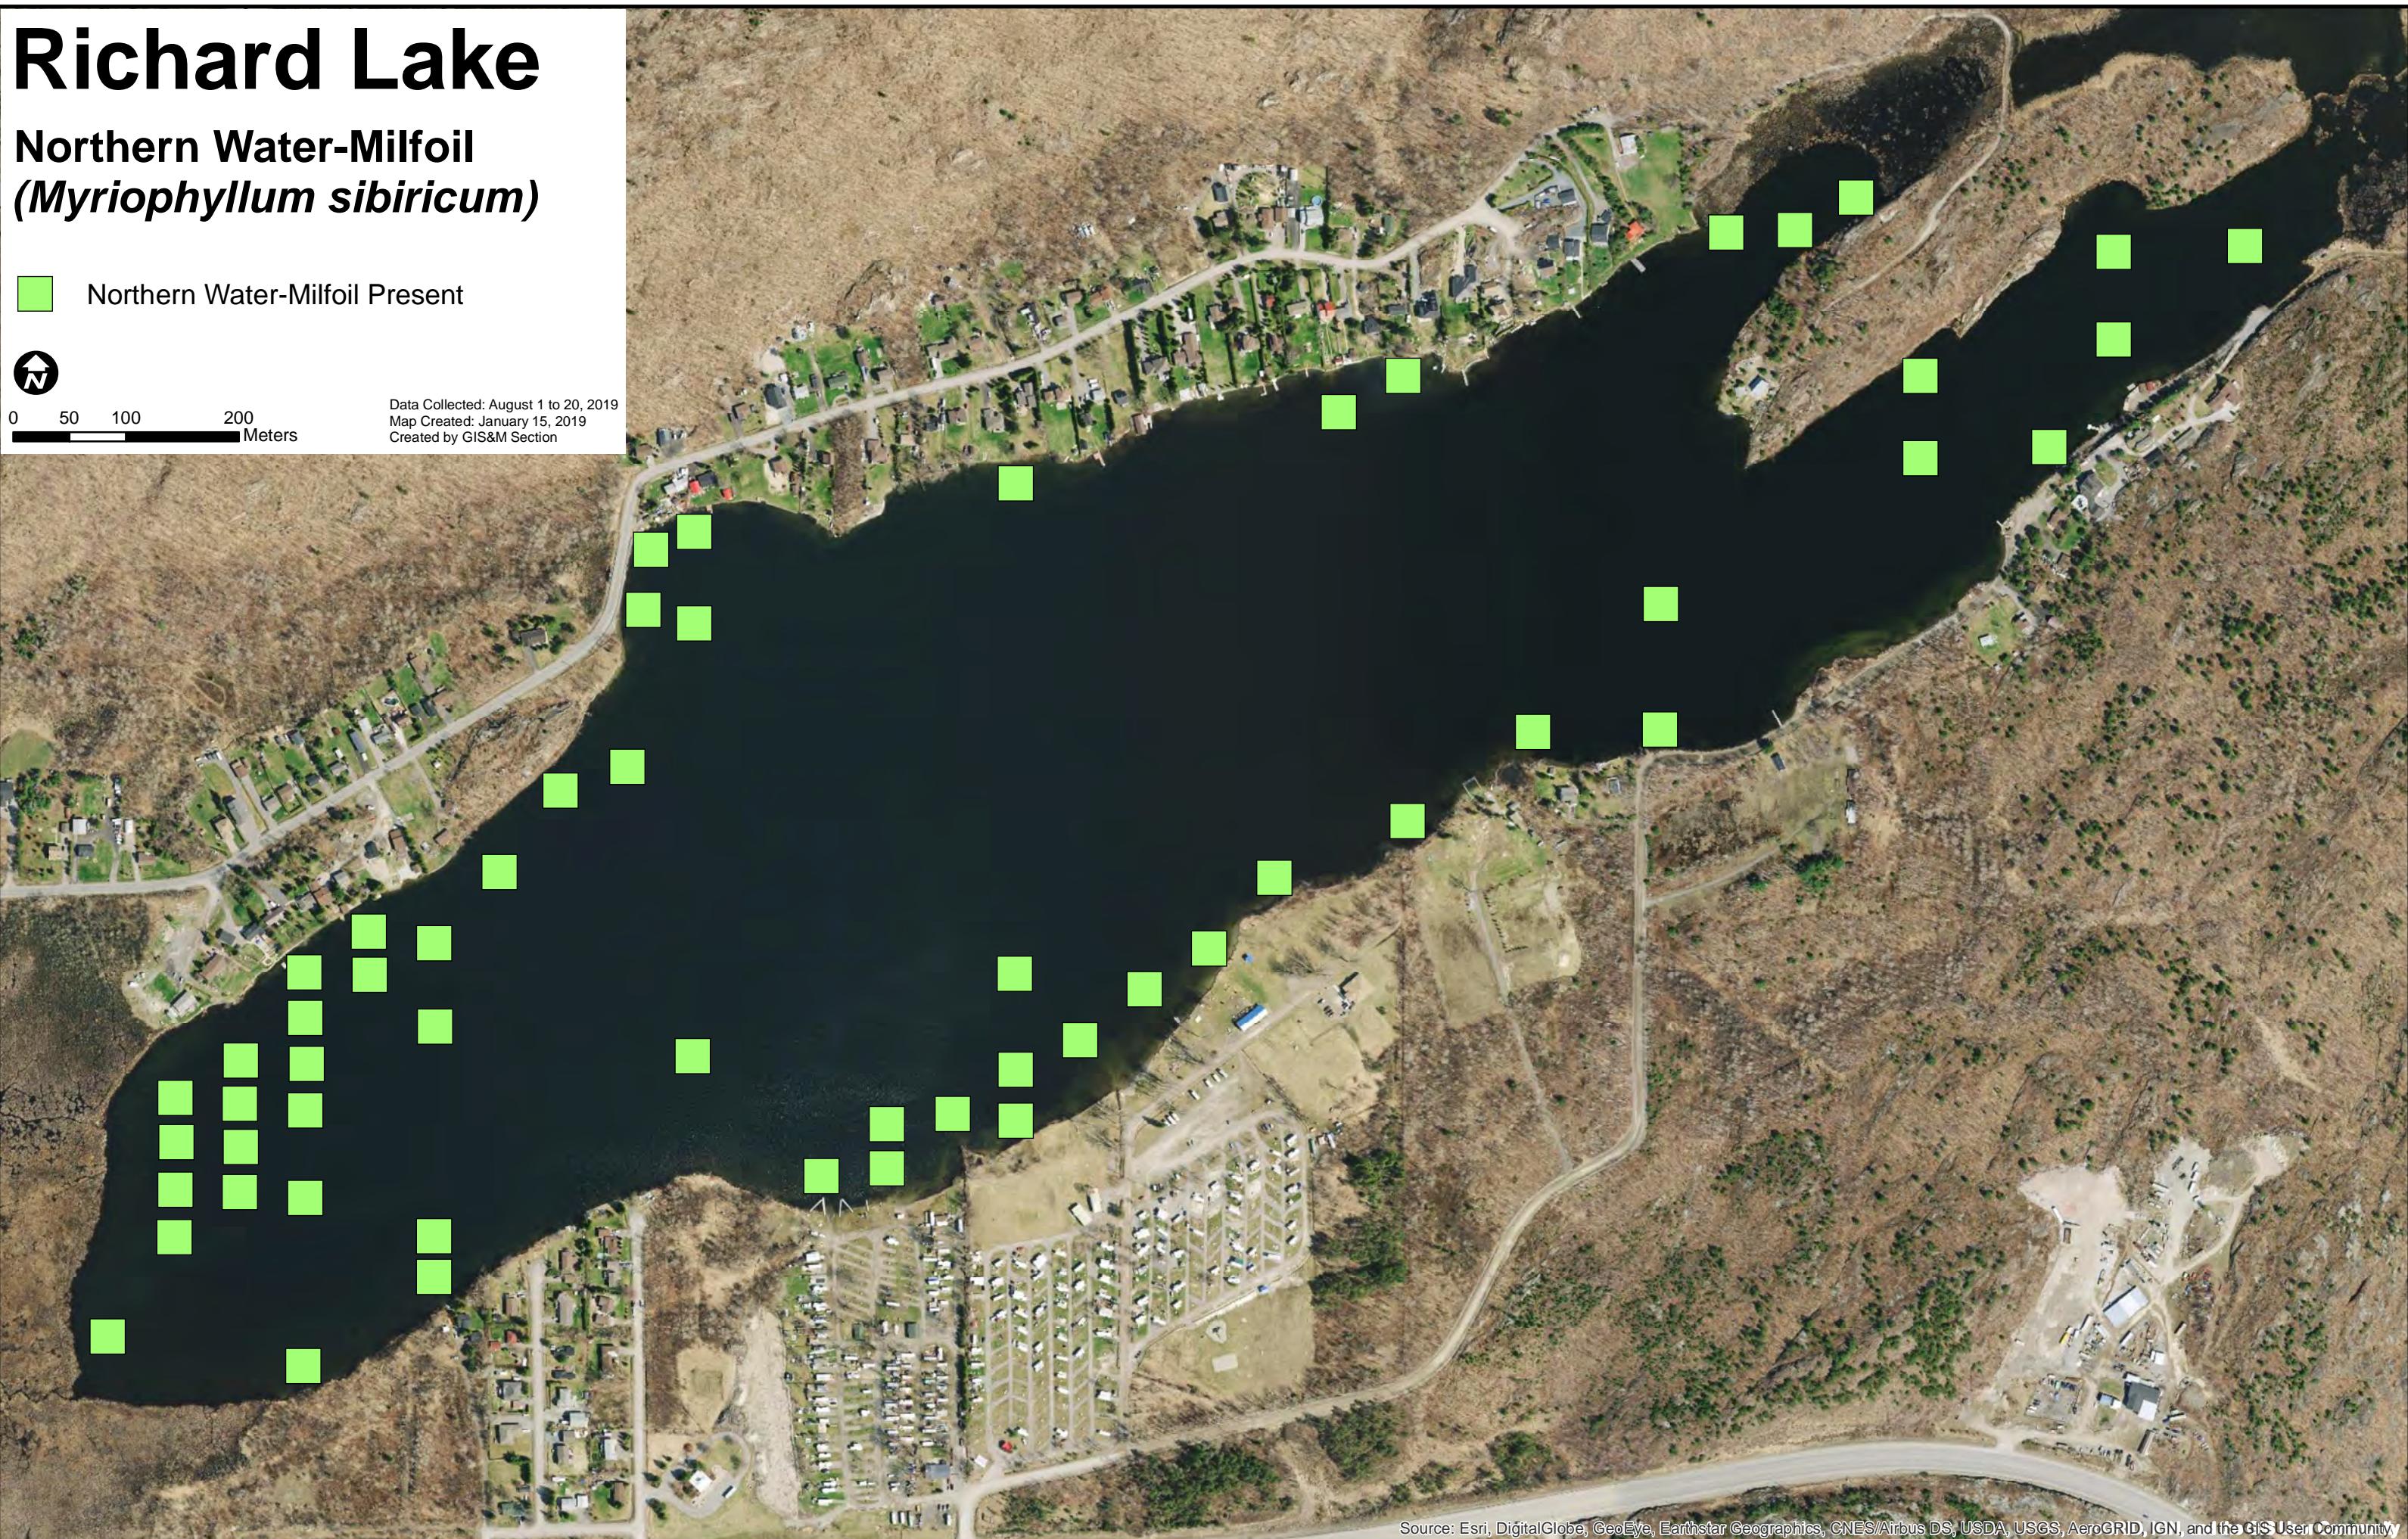

## Northern Water-Milfoil (*Myriophyllum sibiricum*)

 Northern Water-Milfoil Present

0 50 100 200 Meters

Data Collected: August 1 to 20, 2019  
Map Created: January 15, 2019  
Created by GIS&M Section

# Richard Lake

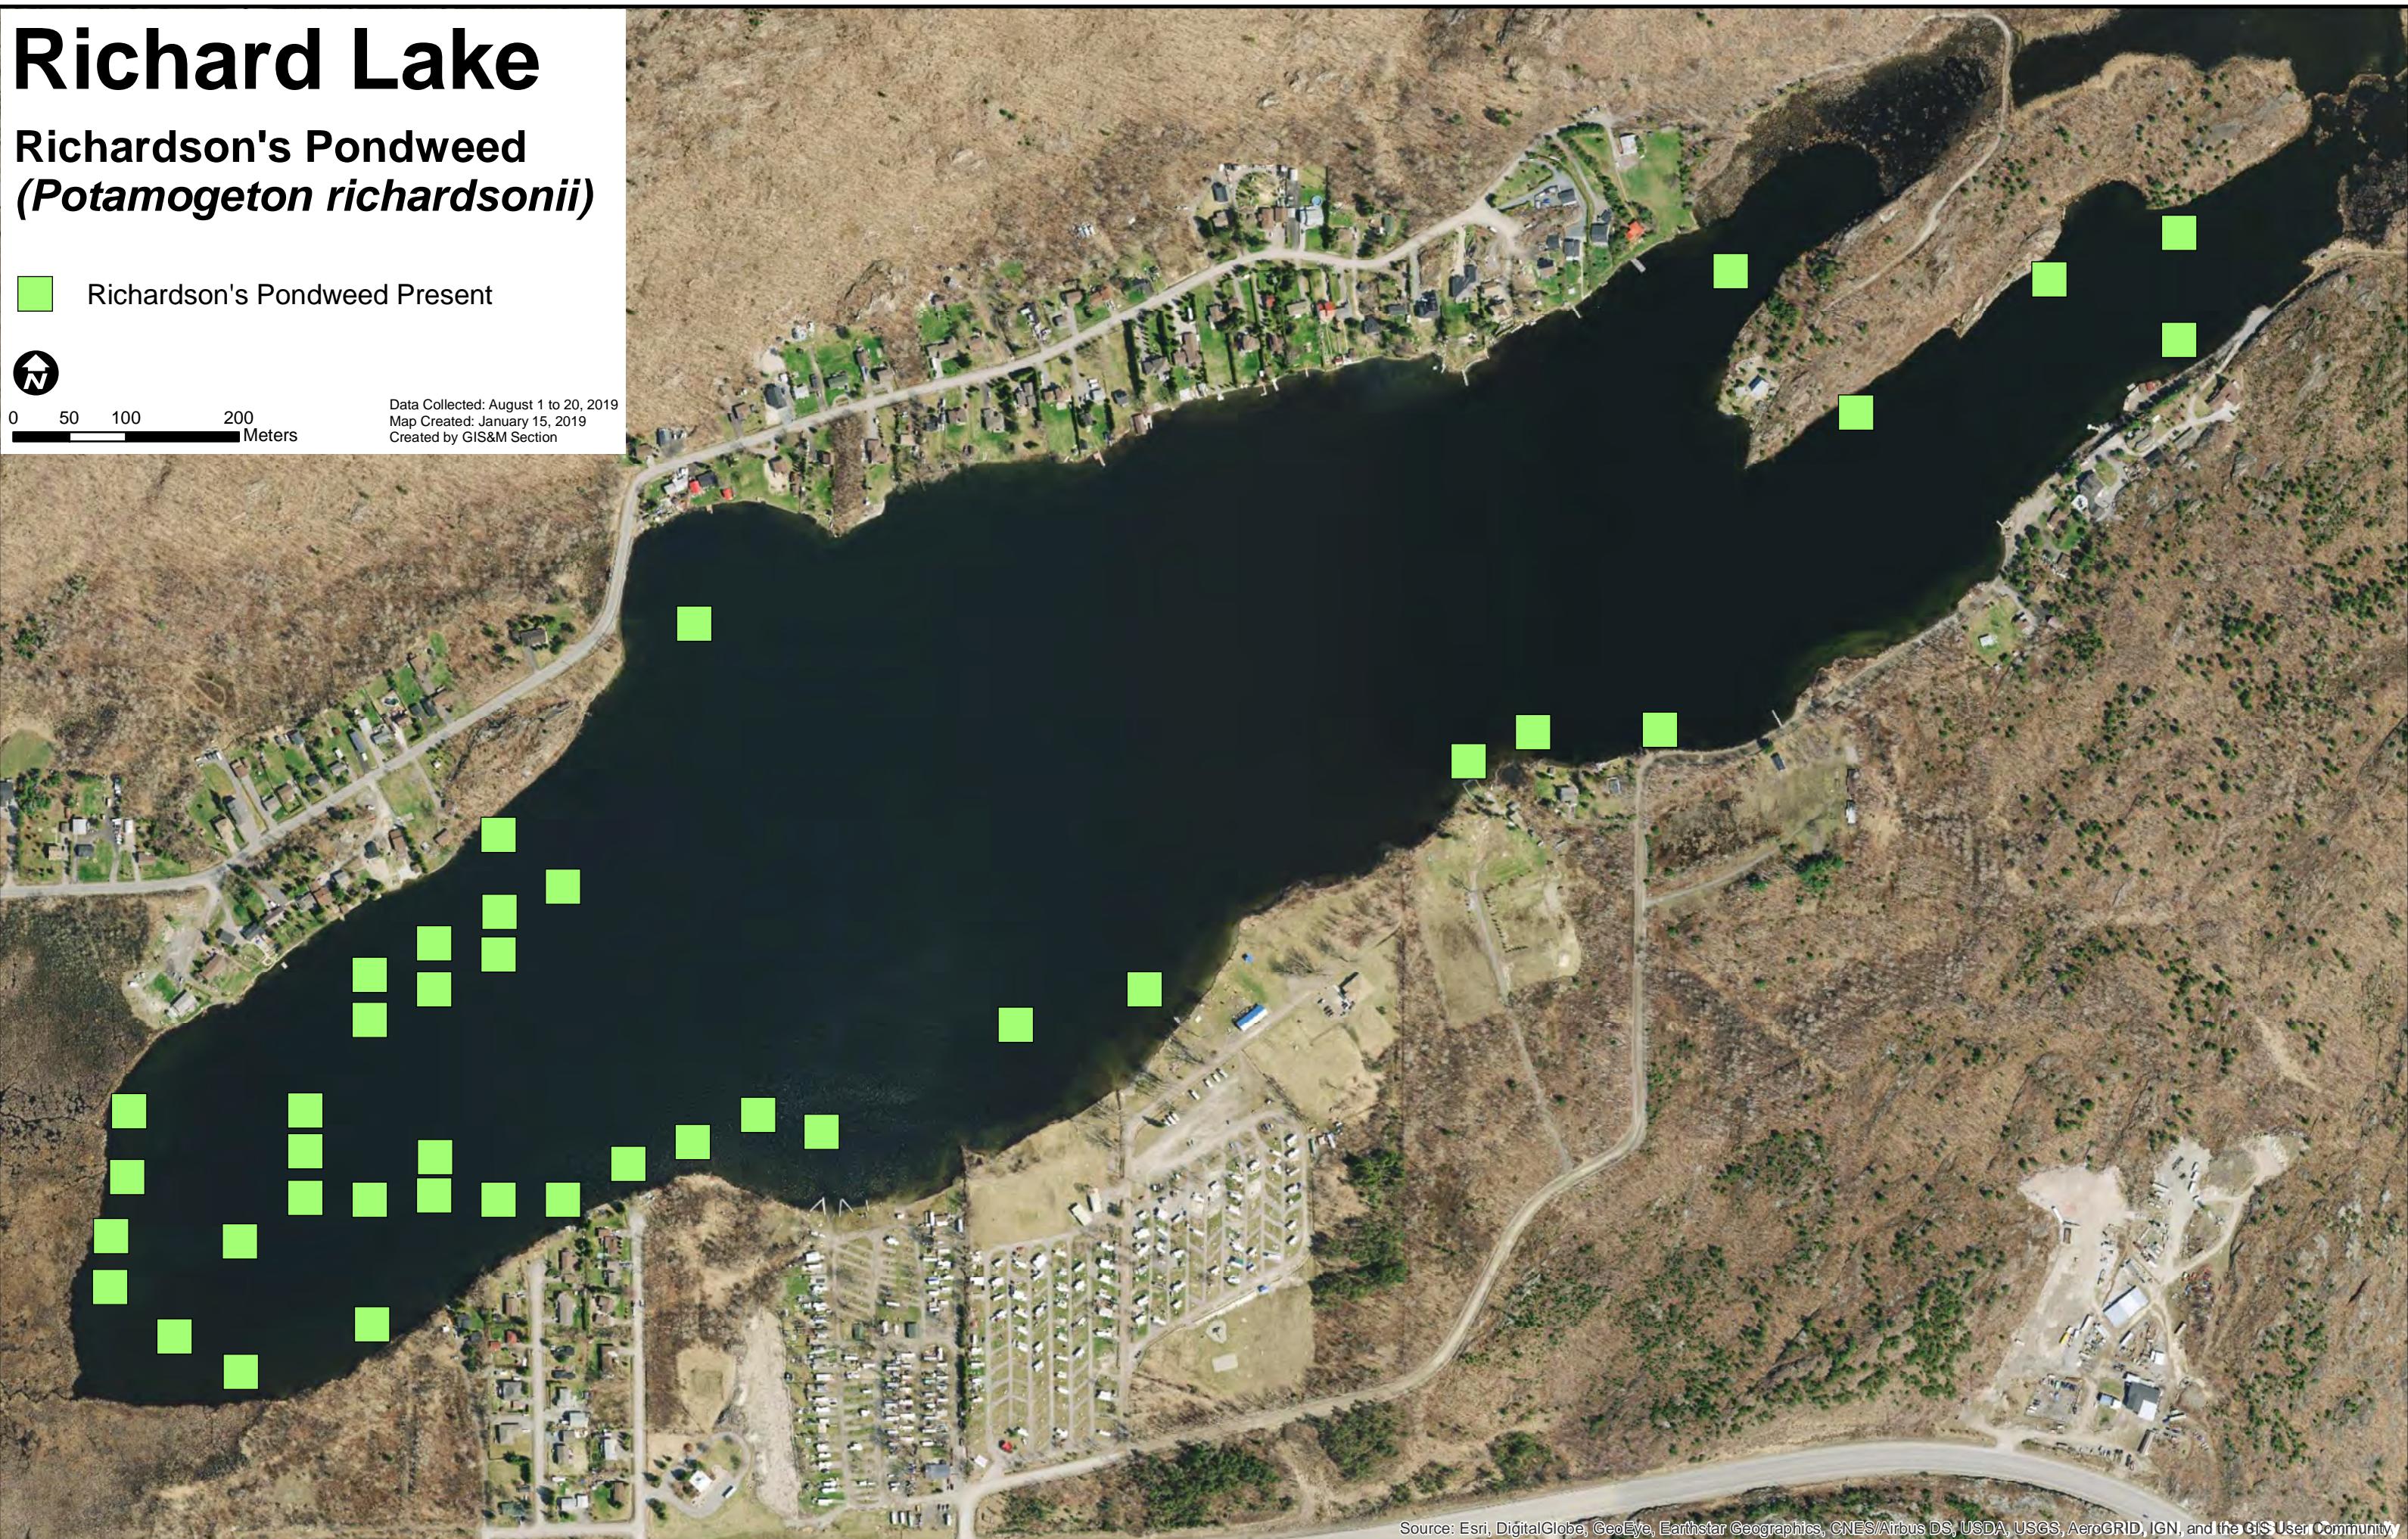

## Richardson's Pondweed (*Potamogeton richardsonii*)

 Richardson's Pondweed Present

0 50 100 200 Meters

Data Collected: August 1 to 20, 2019  
Map Created: January 15, 2019  
Created by GIS&M Section

# Richard Lake

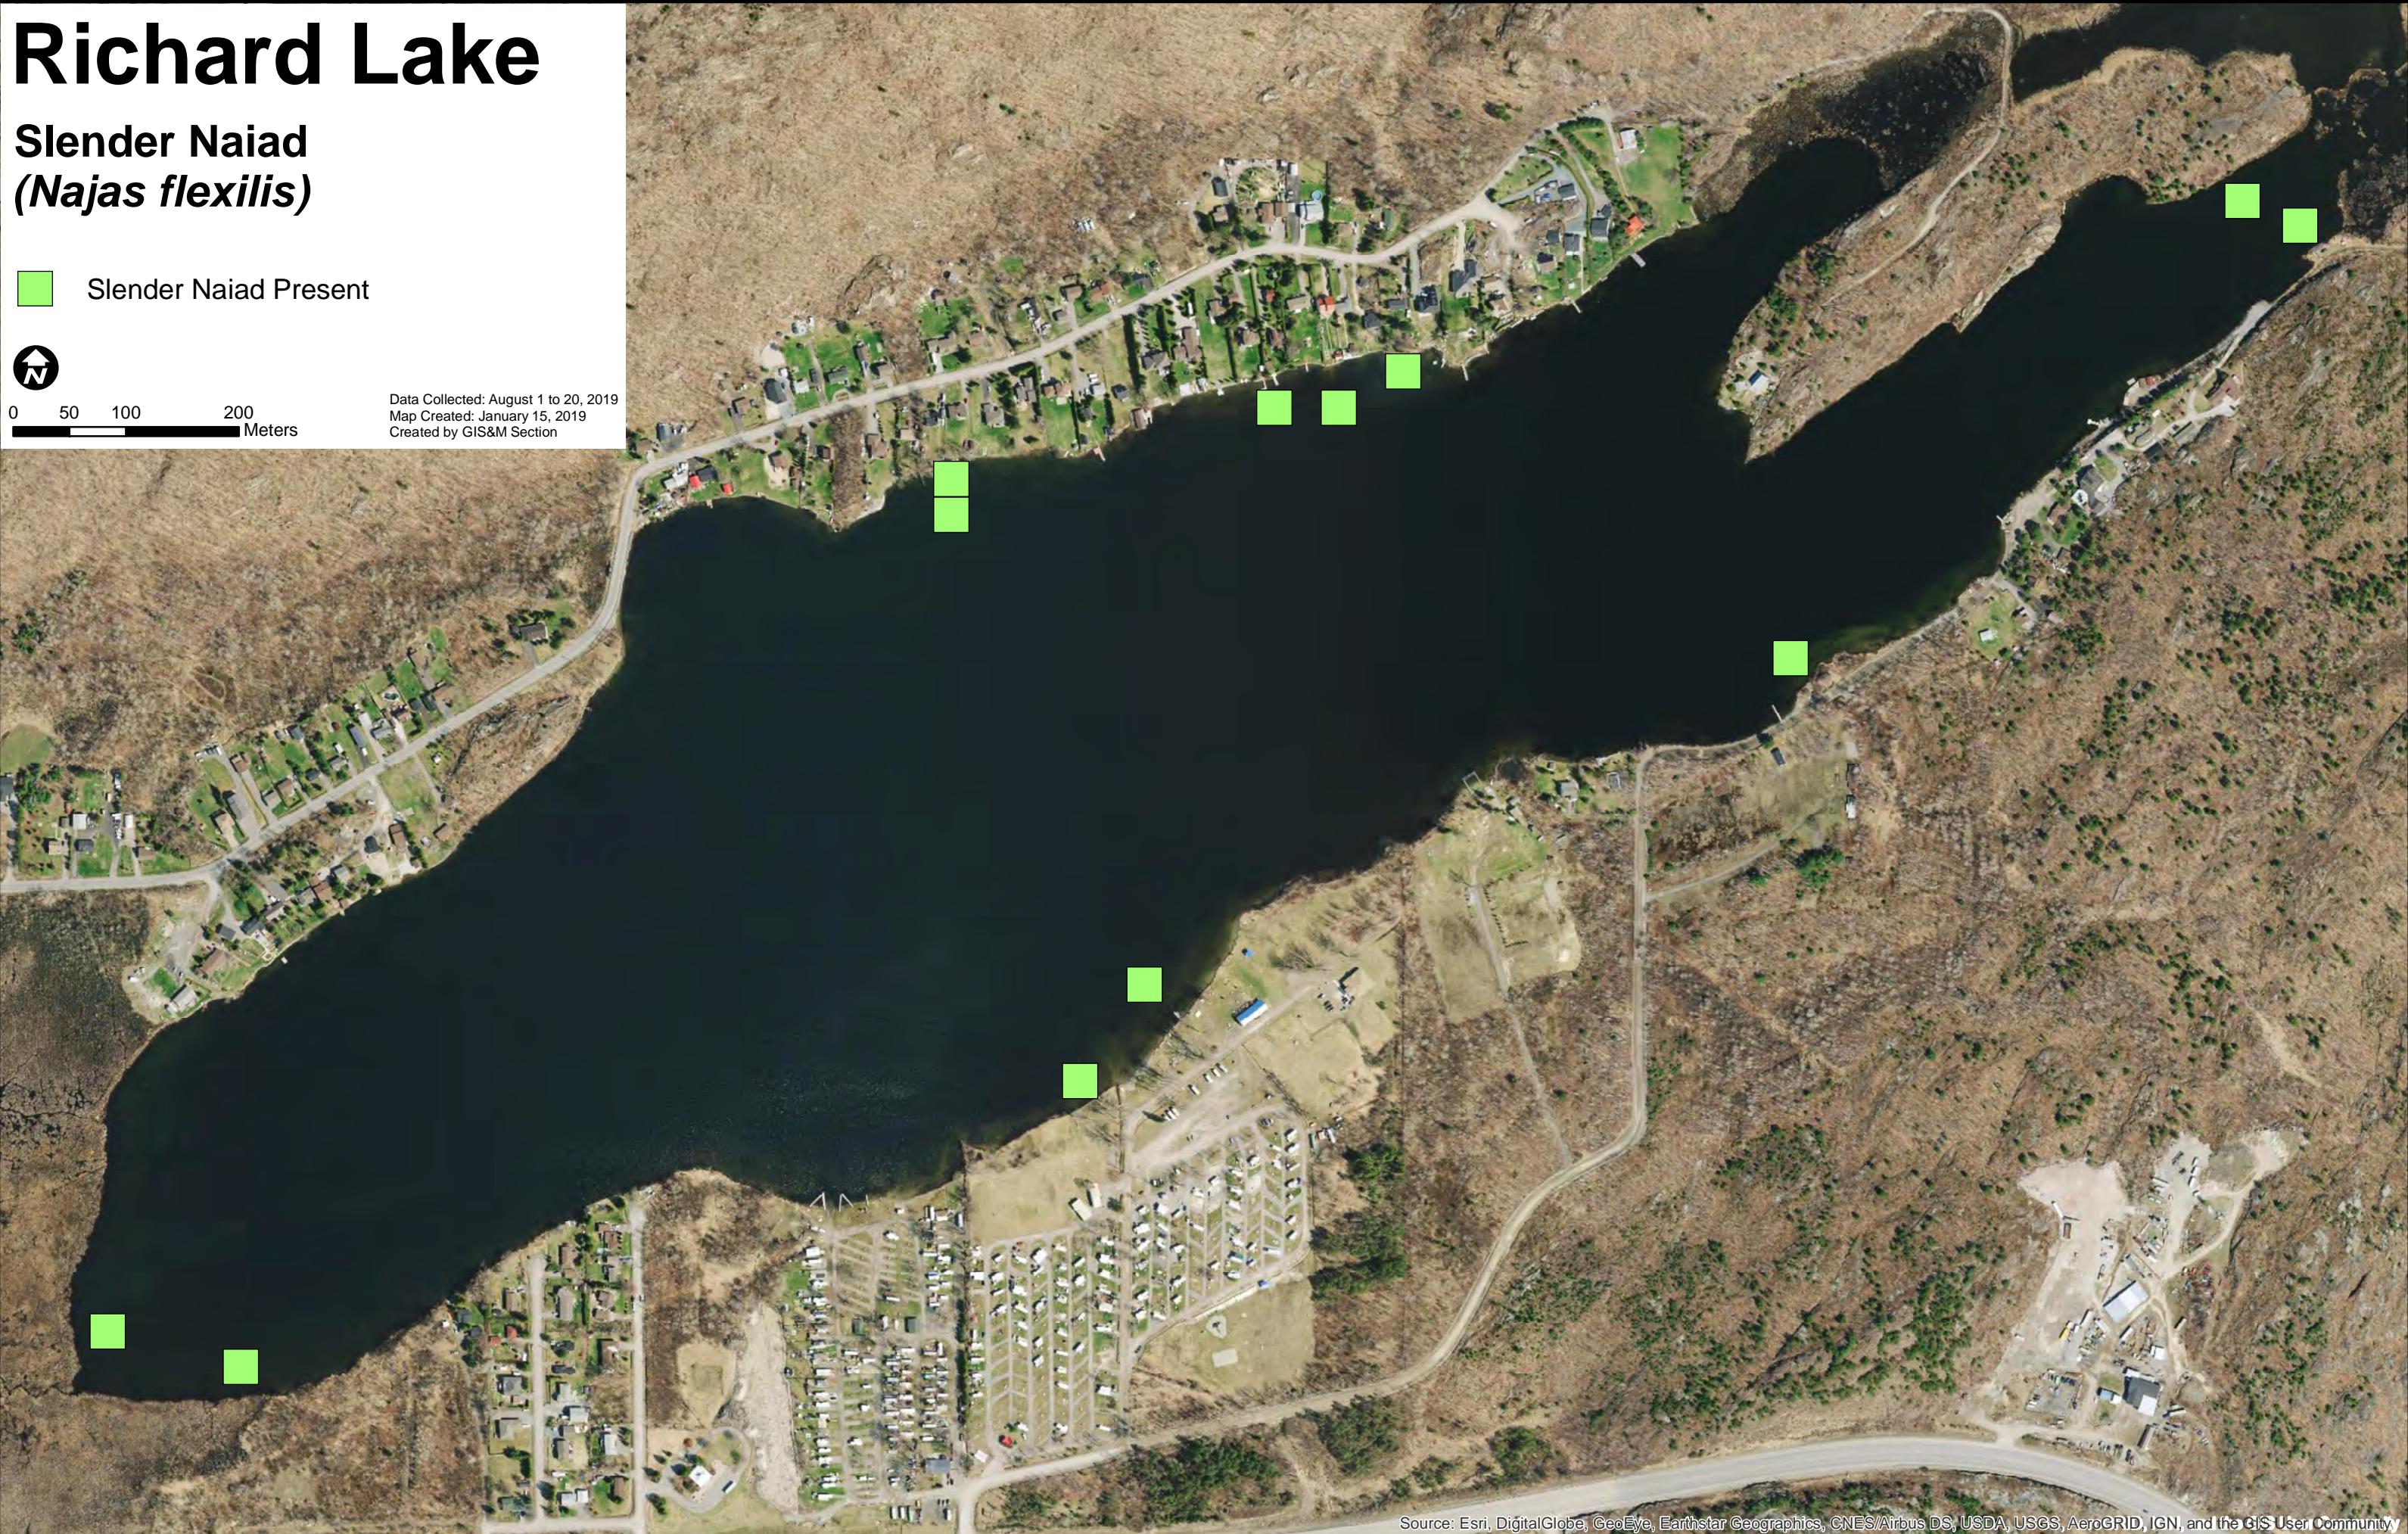

## Slender Naiad (*Najas flexilis*)

 Slender Naiad Present

0 50 100 200 Meters

Data Collected: August 1 to 20, 2019  
Map Created: January 15, 2019  
Created by GIS&M Section

# Richard Lake

## Slender Pondweed (*Potamogeton pusillus*)

 Slender Pondweed Present

0 50 100 200 Meters

Data Collected: August 1 to 20, 2019  
Map Created: January 15, 2019  
Created by GIS&M Section

# Richard Lake

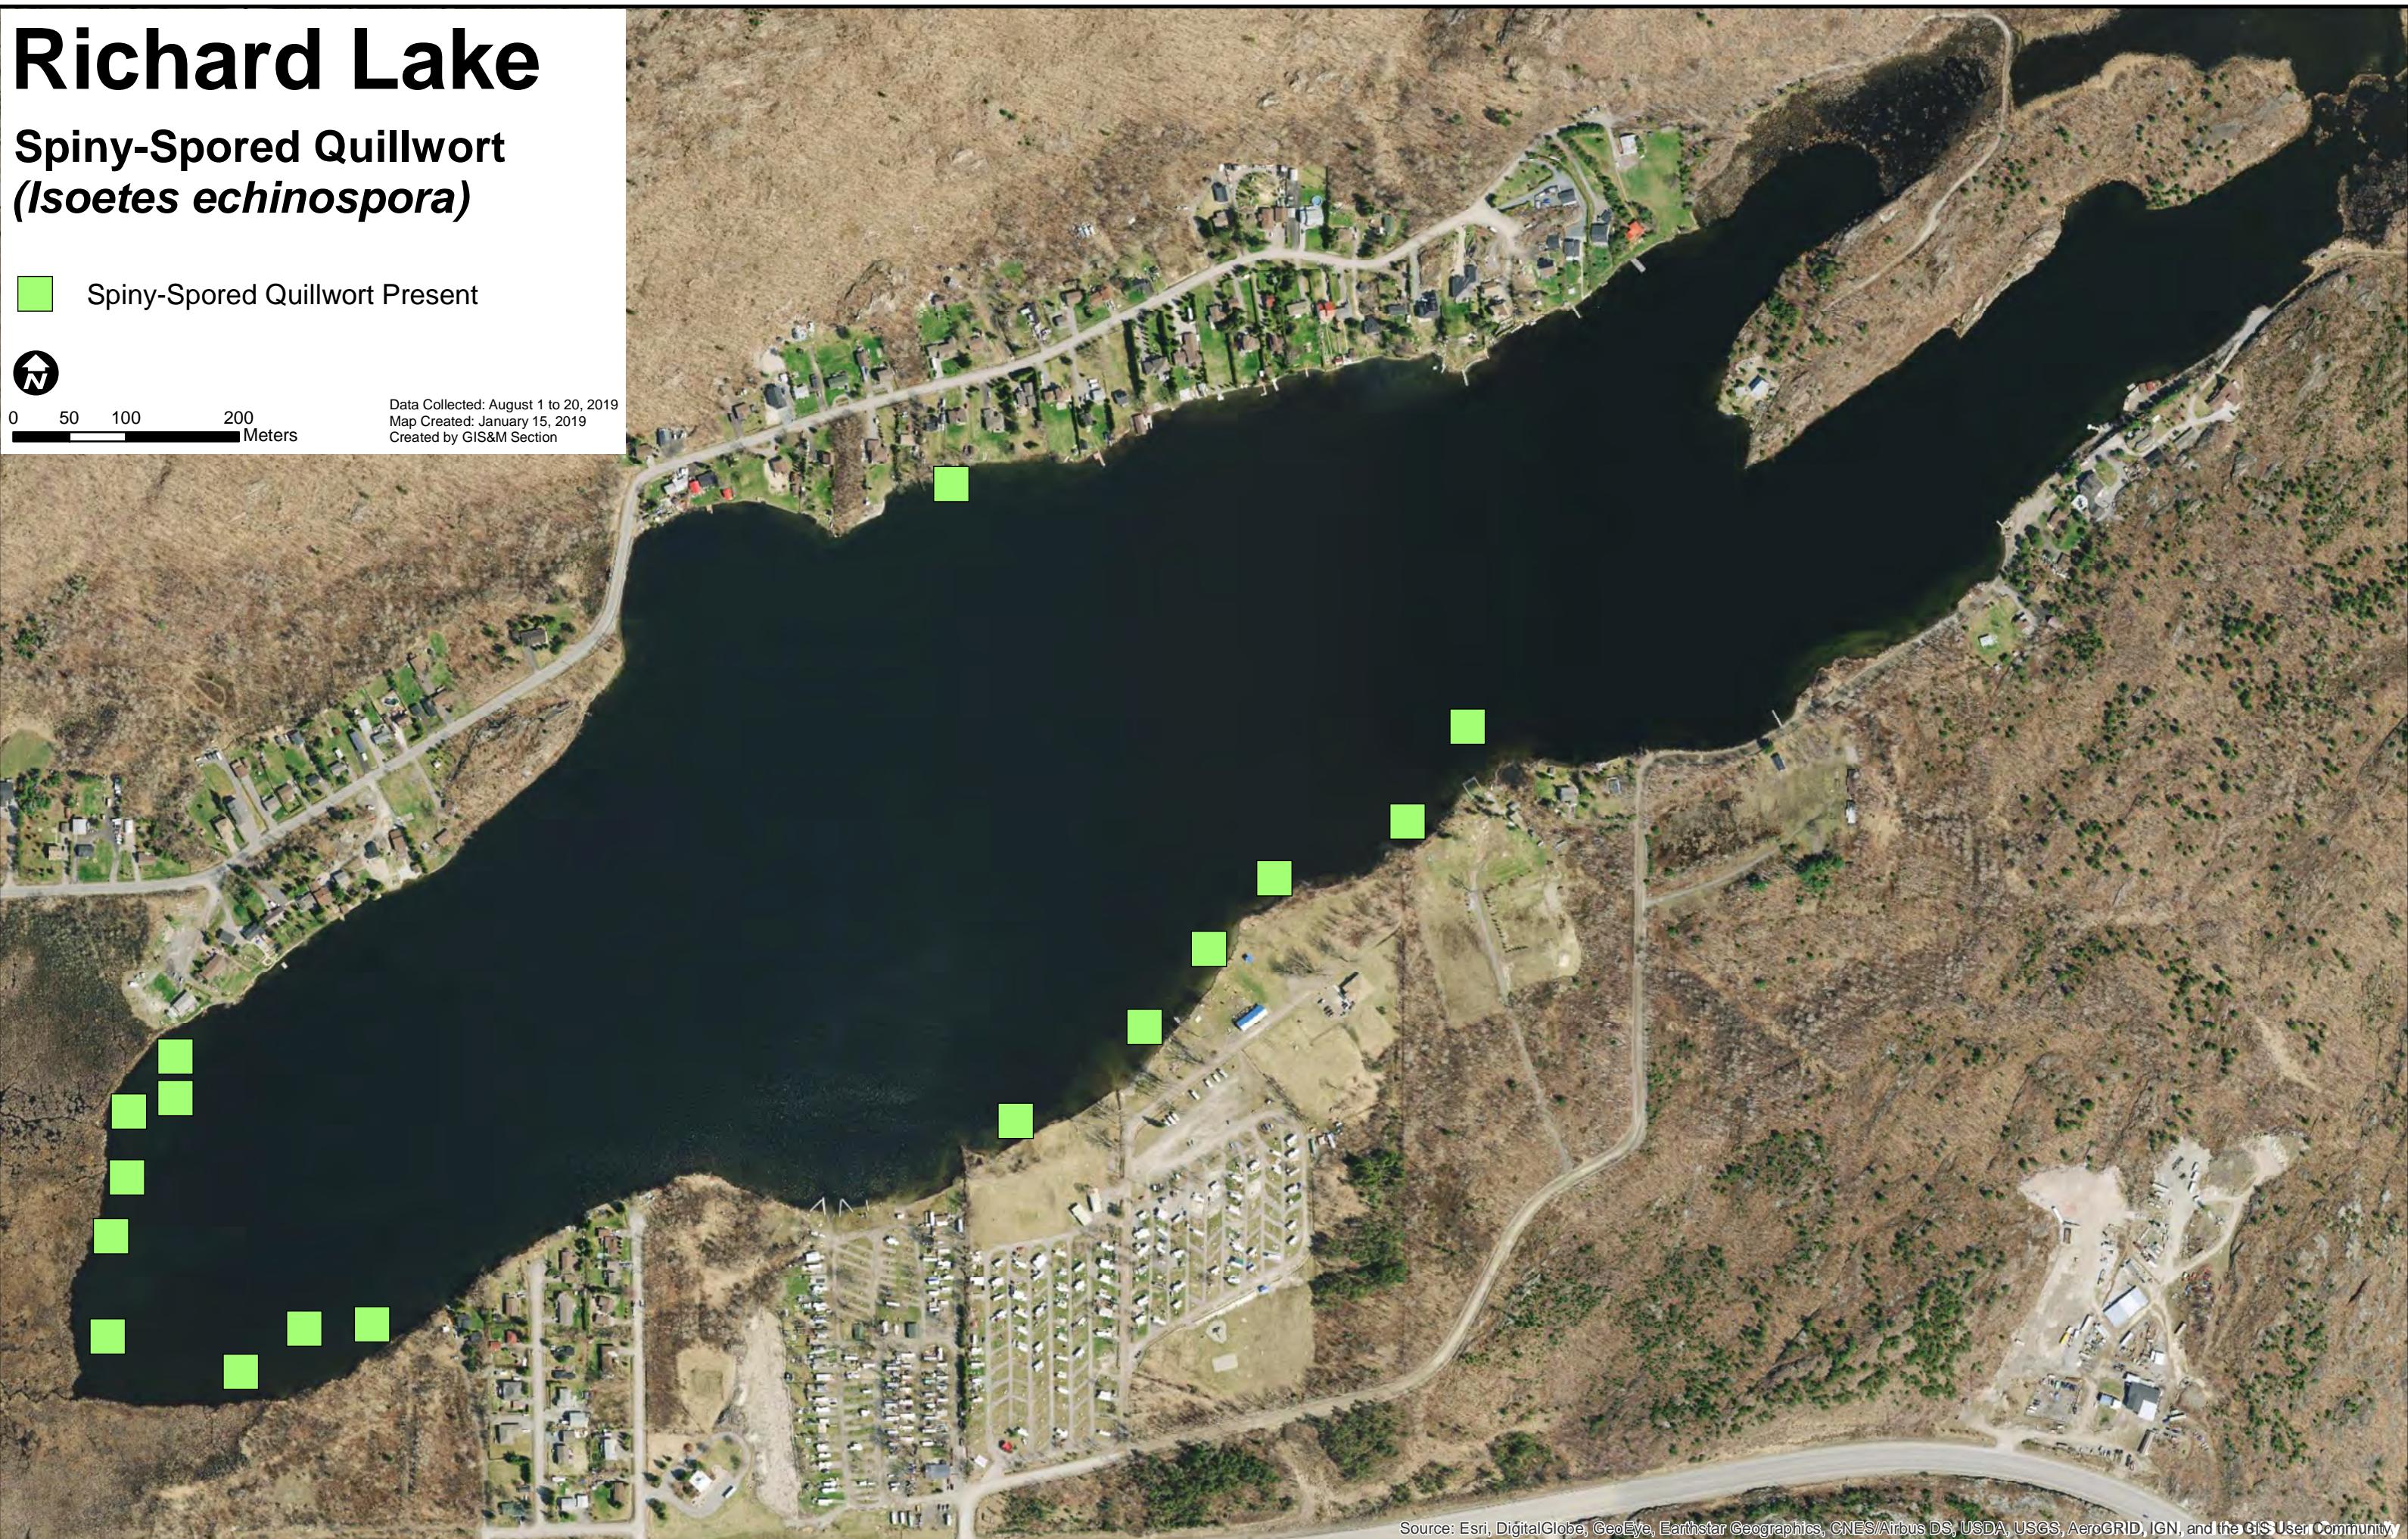

## Spiny-Spored Quillwort (*Isoetes echinospora*)

 Spiny-Spored Quillwort Present

0 50 100 200 Meters

Data Collected: August 1 to 20, 2019  
Map Created: January 15, 2019  
Created by GIS&M Section

# Richard Lake

## Tapegrass (*Vallisneria americana*)

 Tapegrass Present

0 50 100 200 Meters

Data Collected: August 1 to 20, 2019  
Map Created: January 15, 2019  
Created by GIS&M Section

# Richard Lake

## White Water-Lily (*Nymphaea odorata*)

 White Water-Lily Present

0 50 100 200 Meters

Data Collected: August 1 to 20, 2019  
Map Created: January 15, 2019  
Created by GIS&M Section

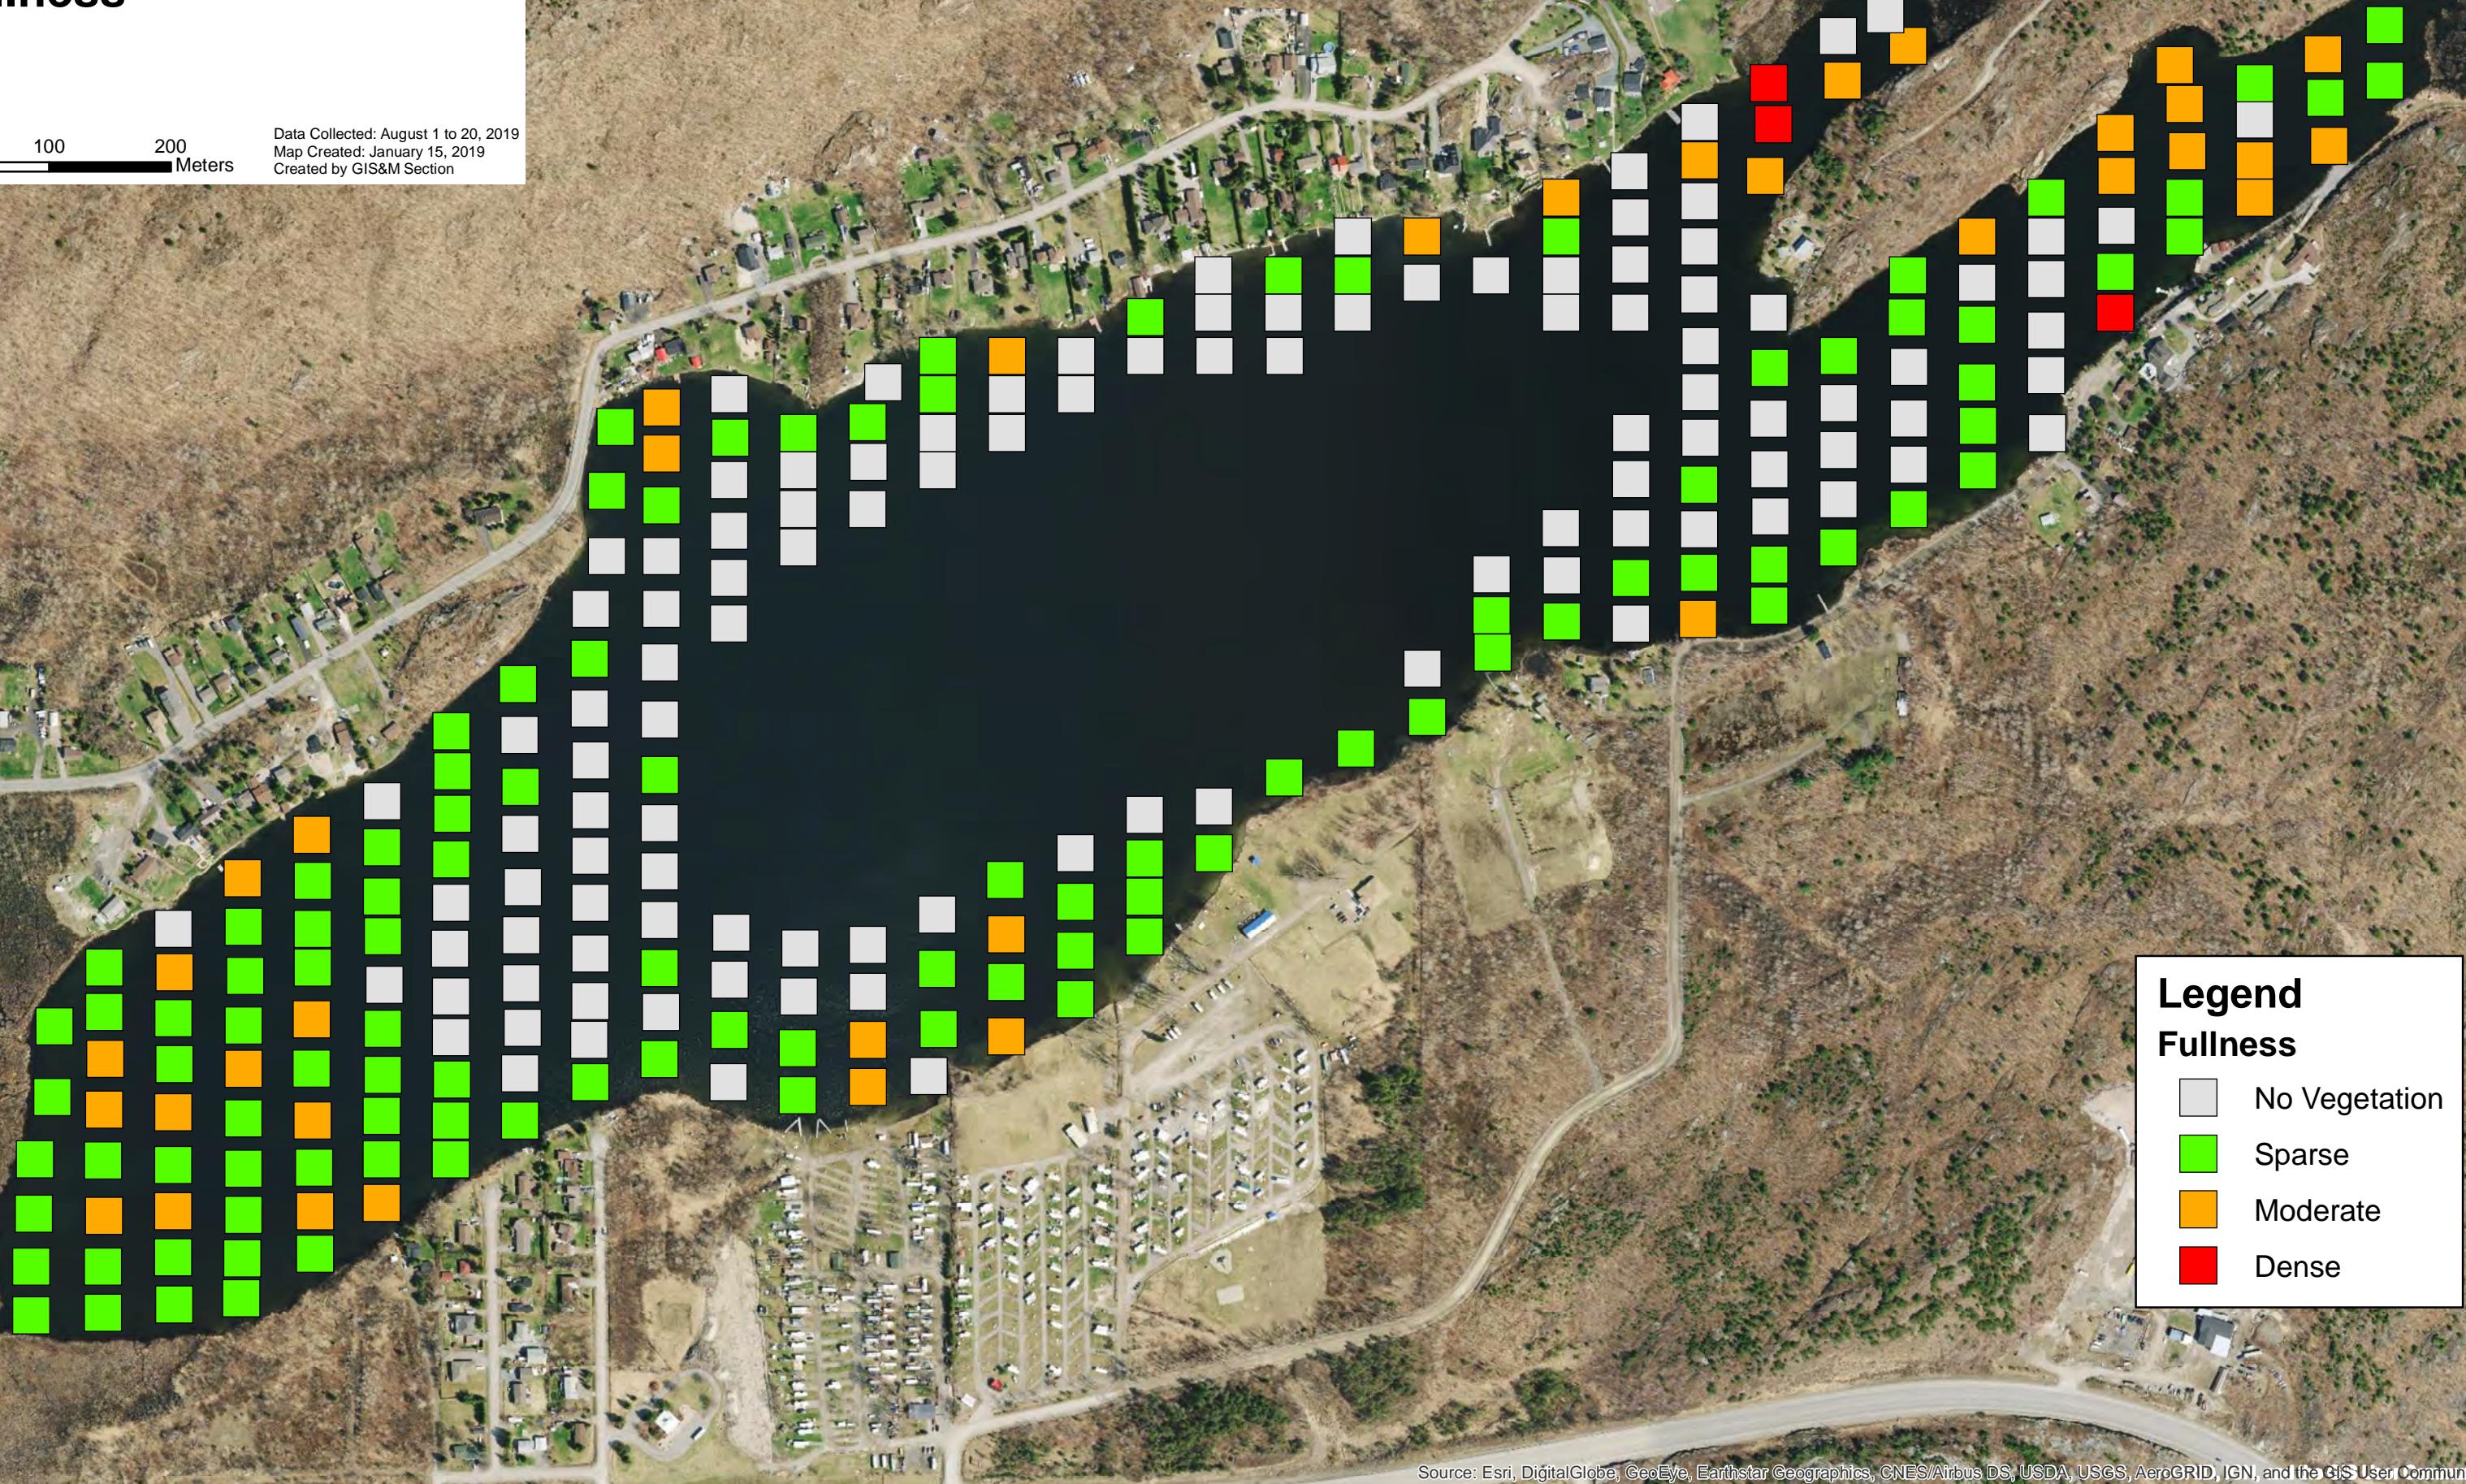

# Richard Lake

## Fullness

0 50 100 200 Meters

Data Collected: August 1 to 20, 2019  
Map Created: January 15, 2019  
Created by GIS&M Section

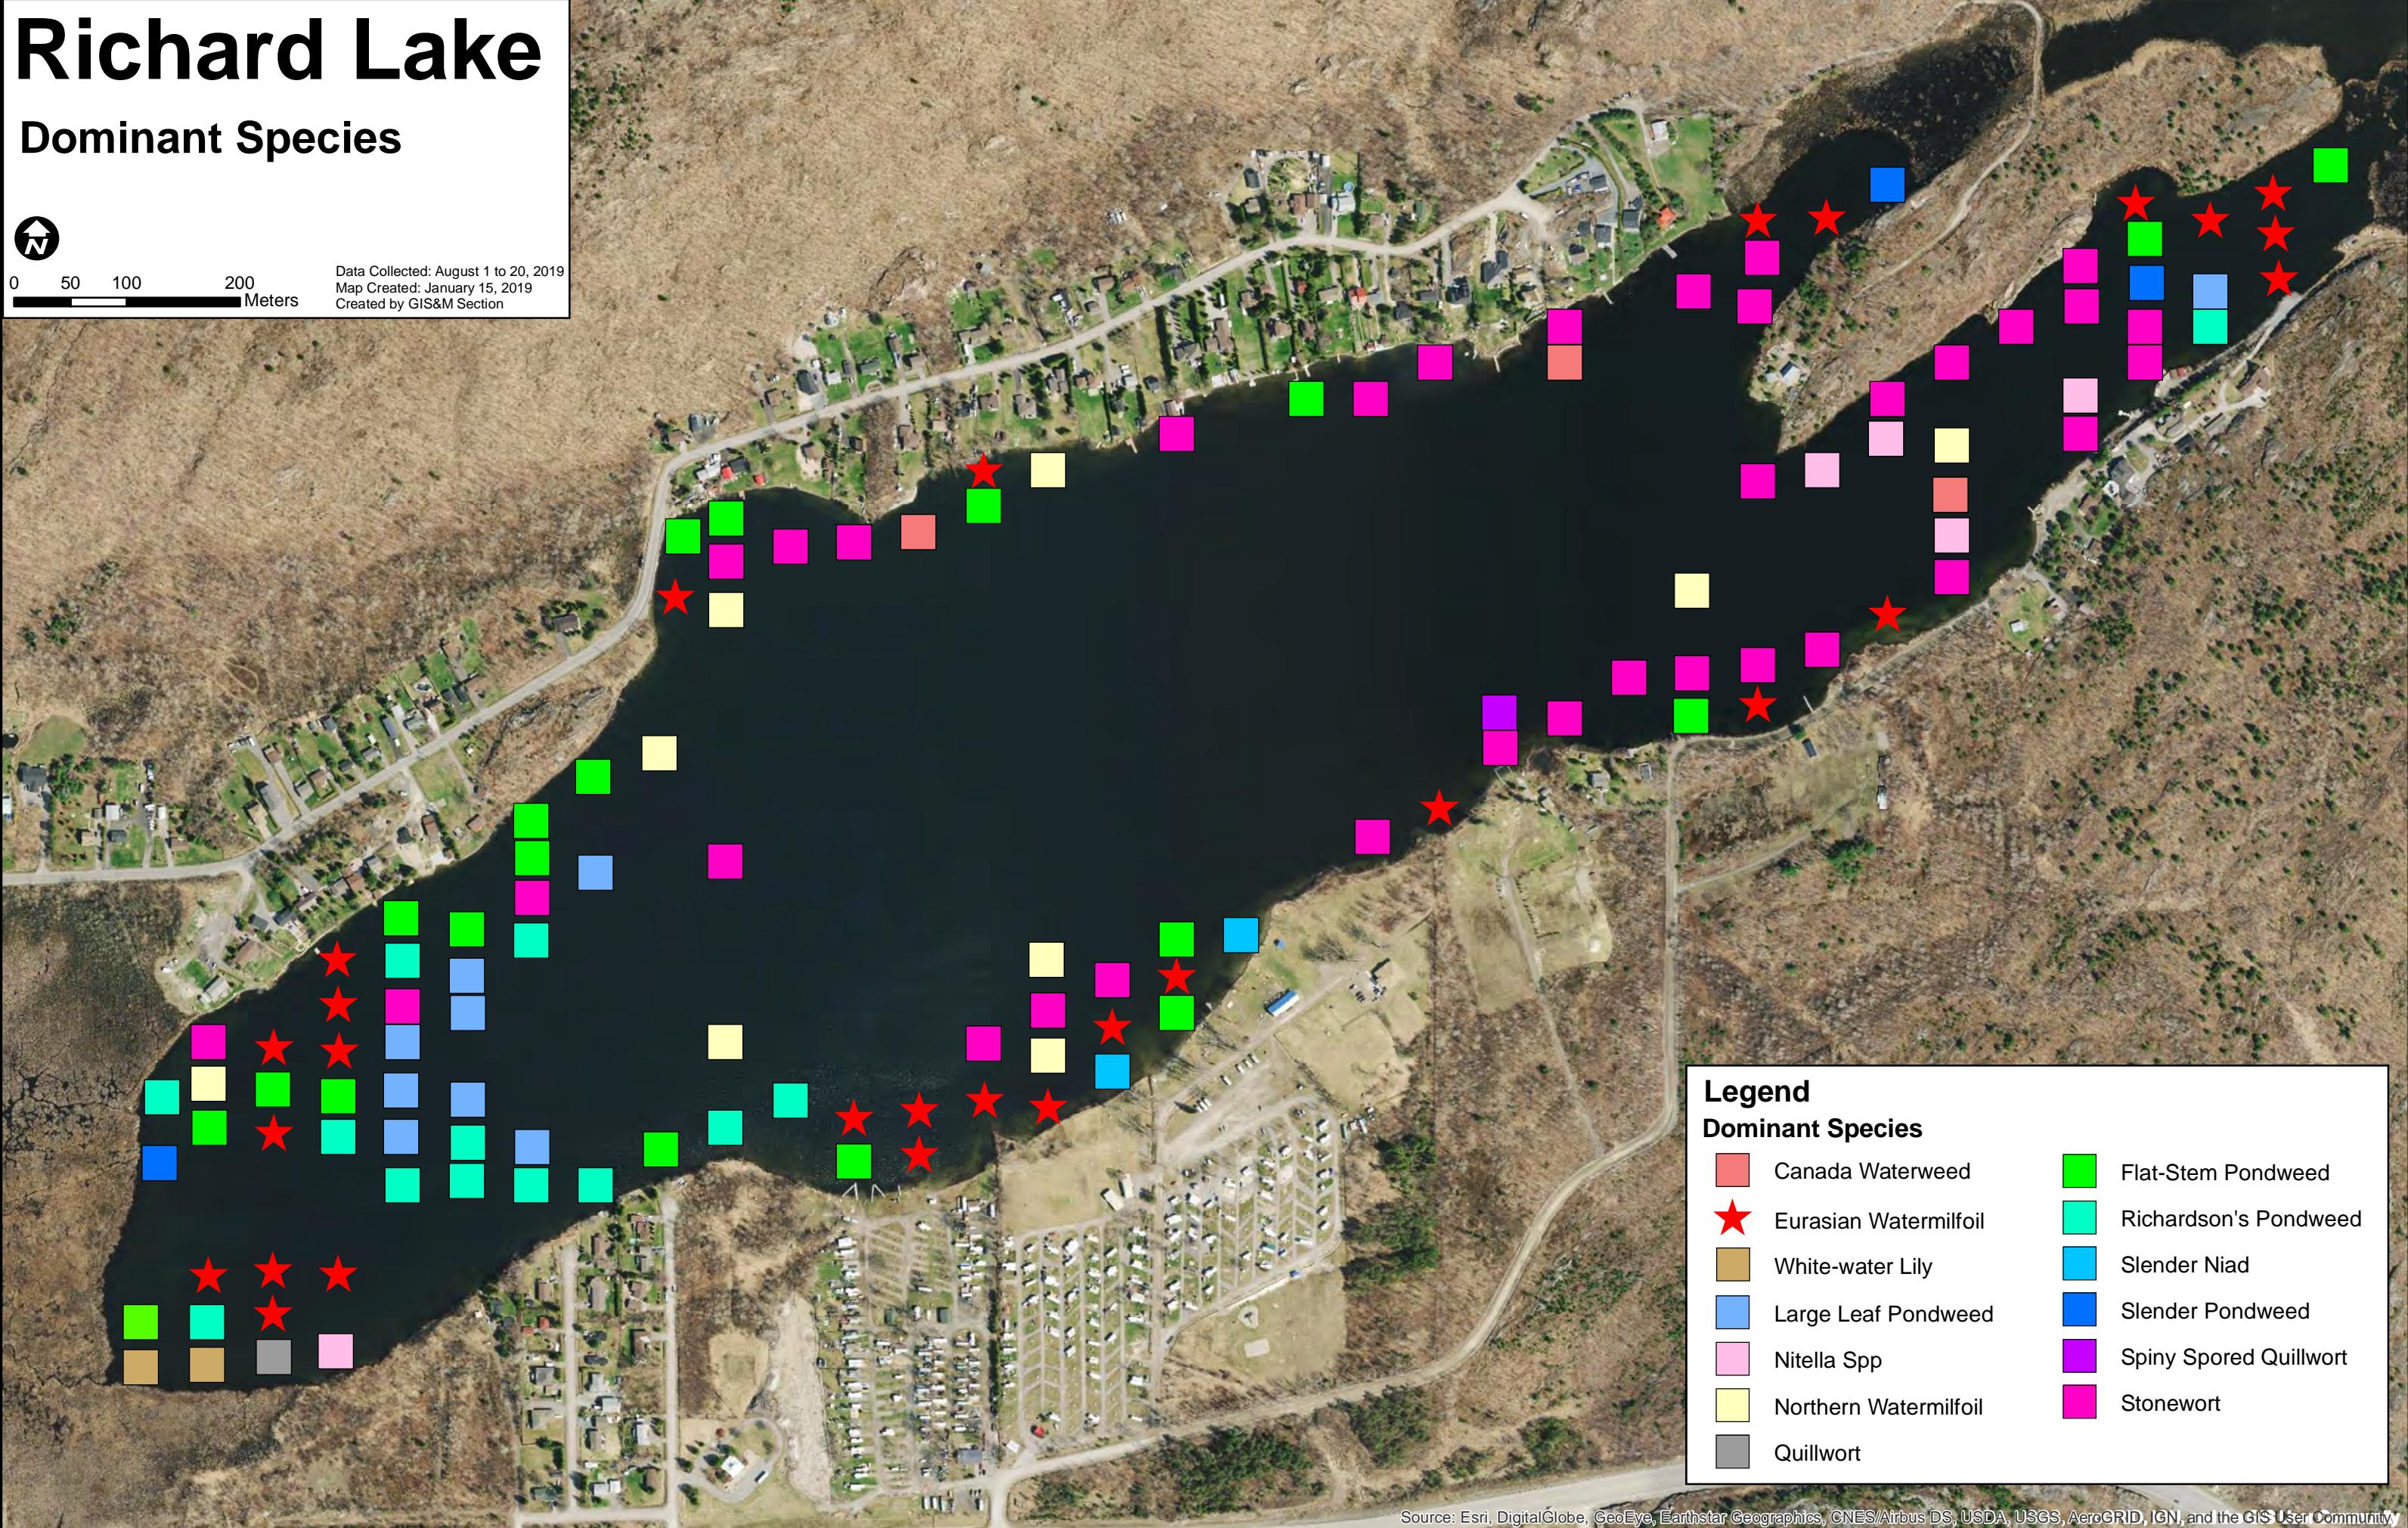

# Richard Lake

## Dominant Species

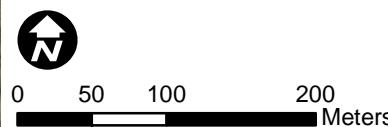

0 50 100 200 Meters

Data Collected: August 1 to 20, 2019  
Map Created: January 15, 2019  
Created by GIS&M Section

# Richard Lake

Eurasian Water-Milfoil  
(*Myriophyllum spicatum*)  
& Northern Water-Milfoil  
(*Myriophyllum sibiricum*)

Data Collected: August 1 to 20, 2019  
Map Created: January 15, 2019  
Created by GIS&M Section
