# Introduction to the Annual Wastewater Report

Under Environmental Compliance Approval (ECA) agreements issued by the Ministry of Environment, Conservation & Parks (MECP), the City is required to report annually on the values/parameters indicated in the ECA and must make this report publicly available within 90 days of January 1<sup>st</sup> for the year preceding the current year. Specifically the annual report is to include:

- a) a summary and interpretation of all monitoring data and a comparison to the effluent limits outlined in conditions described in the Approval, including an overview of the success and adequacy of the Works;
- b) a description of any operating problems encountered and corrective actions taken;
- c) a summary of all maintenance carried out on any major structure, equipment, apparatus, mechanism or thing forming part of the Works;
- d) a summary of any effluent quality assurance or control measures undertaken in the reporting period;
- e) a summary of the calibration and maintenance carried out on all effluent monitoring equipment;
- f) a description of efforts made and results achieved in meeting the Effluent Objectives of the Approval;
- g) a tabulation of the volume of sludge generated in the reporting period, an outline of anticipated volumes to be generated in the next reporting period and a summary of the locations to where the sludge was disposed;
- h) a summary of any complaints received during the reporting period and any steps taken to address the complaints;
- i) a summary of all by-pass, plant overflow, overflow, spill or abnormal discharge events;
- j) any other information the Water Supervisor requires from time to time; and
- k) a copy of all Notices of Modification submitted to the Water Supervisor.

To address these requirements, this report contains the following sections;

1. **Operating Issues & Corrective Actions;** Measured values resulting in a non-compliance with respect to a parameter listed within an ECA and the corrective actions taken to resolve the issue.
2. **Maintenance & Capital Improvements;** All major maintenance, modifications and capital works completed at the facility within the reporting period.
3. **Calibrations & Maintenance:** Details on the calibration and maintenance carried out on all effluent monitoring equipment.
4. **Sludge Disposal;** The volume of sludge received and treated at the Sudbury Biosolids facility from the Sudbury WWTP, other wastewater treatment facilities and licensed septage haulers.
5. **Customer Complaints (ACR);** Any complaints received regarding Wastewater Treatment facilities through the City of greater Sudbury 311 (ACR) system during the reporting period and any steps taken to address the complaints.
6. **Plant Bypasses and Overflows;** A listing of all bypasses, spills and overflows at the facility during the reporting period.
7. **Effluent Quality & Control Measures;** A summary and interpretation of all monitoring data collected and a comparison to the parameters and limits given in the ECA for each facility.
8. **Individual Plant Annual Data Reports;** Tables showing all required reporting values and parameters for each wastewater treatment plant of which the City of Greater Sudbury is the owner, including a graphical representation of flows through the plant.

## Definitions

- *Alkalinity*: a measurement of the ability of water to neutralize acid by absorbing hydrogen ions;
- *Average Concentration*: the mean of all Single Sample Results of the concentration of a contaminant in a given stream (influent/effluent) measured during a specified time period;
- *Average Flow*: the cumulative total influent or effluent flow measured during a defined time period (annual, monthly, etc.) divided by the number of days during that specified period;
- *Average Loading*: the value obtained by multiplying the Average Concentration of a contaminant in a given stream (influent/effluent) by the Average Flow for that stream;
- *BOD<sub>5</sub>*: the five day biochemical oxygen demand measured in an unfiltered sample and includes carbonaceous and nitrogenous oxygen demands;
- *Bypass*: the diversion of sewage around one or more treatment processes, excluding Preliminary Treatment System, with the diverted sewage flows being returned to the Sewage Treatment Plant treatment train upstream of the Final Effluent sampling point(s) and discharged via the approved effluent disposal facilities;
- *CBOD<sub>5</sub>*: the five day carbonaceous biochemical oxygen demand of biological organisms in the material, without the impact of oxygen depletion by nitrogenous bacteria;
- *E. coli*: coliform bacteria that possess the enzyme beta-glucuronidase and are capable of cleaving a fluorogenic or chromogenic substrate with the corresponding release of a fluorogen or chromogen, that produces fluorescence under long wavelength (366 nm) UV light, or color development, respectively. Data are reported as colony forming units (CFU) per 100 mL;
- *Event*: an action or occurrence, at a given location within the Works that causes a Bypass or Overflow. An Event ends when there is no recurrence of Bypass or Overflow in the 12-hour period following the start of the event;
- *Final Effluent*: effluent that is discharged to the environment through the approved effluent disposal facilities, including all Bypasses, that are required to meet the compliance limits stipulated in the Approval for the Sewage Treatment Plant at the Final Effluent sampling point(s);
- *Influent*: flows to the Sewage Treatment Plant from the collection system. Flows can fluctuate according to weather conditions and high flows are commonly due to Inflow and Infiltration, a condition that allows rain and/or snow melt to enter the sanitary sewer.;
- *Monthly Geometric Mean Density*: the mean of all Single Sample Results of E. coli measurement in the samples taken during a calendar month, calculated and reported as per the methodology specified by the MECP;
- *Nitrite*: the amount of nitrogen present in the effluent as the NO<sub>2</sub><sup>-</sup> anion;
- *Nitrate*: the amount of nitrogen present in the effluent as the NO<sub>3</sub><sup>-</sup> anion;
- *Overflow*: a discharge to the environment at location(s) other than the approved effluent discharge;
- *pH*: the potential of hydrogen measured on a 14 point scale where 0 represents highly acidic material, 14 represents highly basic material and 7 represents neutral material (such as water);
- *Rated Capacity*: the Annual Average Daily Influent Flow for which the facility is designed to process;
- *T Amm*: the total ammonia measured in the final effluent;
- *TKN*: Total Kjeldahl Nitrogen; the total concentration of organic nitrogen & ammonia in the effluent;
- *TP*: Total Phosphorous; the total amount of phosphorous measured in the final effluent;
- *TSS*: Total Suspended Solids; the total amount of residual solid matter in the final effluent;
- *Un-ionized Amm*: the calculated amount of un-ionized ammonia in the final effluent;

### **3. Calibrations & Maintenance**

All analyzers at all plants are calibrated as per manufacturer's recommendations, a minimum of once per year. Calibration Certificates are submitted and retained electronically for each unit.

All major plant equipment is maintained as per manufacturer's recommendations, with regular preventive maintenance checks completed as per established schedules.

### **4. Sludge Disposal**

Sludge produced and removed from all Wastewater Treatment Plants in the City of Greater Sudbury, along with hauled liquid waste from other sources, is processed at the Sudbury Biosolids facility. Hauled liquid waste is any domestic sewage collected & transported by licensed haulers that is suitable for treatment, including:

- Waste removed from cesspools, septic tanks, privy pits, chemical toilets, portable toilets or sewage holding tanks and grey water from residential activities;
- Sewage from on-board holding tanks (e.g. RVs, tour buses, boats, etc.), and;
- Sludge from wastewater treatment facilities in neighbouring municipalities (for example, Espanola).

This Biosolids facility, operated under a Public Private Partnership by Walker Industries and located on the grounds of the Sudbury Wastewater Treatment Plant, produces a soil amendment by mixing dewatered septage & sludge with cement kiln dust and/or quicklime, to attain pathogen pasteurization. The product is a granular material, which is applied to agricultural soils for nutrient and pH enhancement.

In 2020, the Sudbury Biosolids facility treated a total of 120,413 m<sup>3</sup> of material, containing approximately 3,619 tonnes of solids. Of this total, approximately 16,392 m<sup>3</sup> was from septic tanks, 42,708 m<sup>3</sup> was sludge from other CGS facilities and 4,351 m<sup>3</sup> was sludge received from the Espanola Wastewater Treatment Plant.

## **Chelmsford Water Pollution Control Plant**

The ECA for the Chelmsford WPCP details different effluent limits based on two seasonal discharge periods; one from April 30<sup>th</sup> to November 1<sup>st</sup> and the other from May 1<sup>st</sup> to October 31<sup>st</sup>.

Disinfection of the final effluent and reporting of sample results for E. Coli is only required in the summer discharge period from May 1<sup>st</sup> to October 31<sup>st</sup>. The ECA limits for effluent pH are the same in both discharge periods.

## Wahnapietae Lagoons

The Wahnapietae Lagoons are subject to seasonal discharge requirements. The Fall discharge period is defined as any discharge with a minimum duration of 14 days starting not before November 1<sup>st</sup> and not after December 15<sup>th</sup>. The Spring discharge period is defined as any discharge with a minimum duration of 14 days starting not before March 15<sup>th</sup> and not after April 30<sup>th</sup>.

Due to the limited sampling performed at the Wahnapietae Lagoons, plant removal values are calculated using the previous available raw (influent) sample when one is not present in the same month as an effluent sample.
